CC -1- FUNCTION: Required for neural tube formation. Essential for normal
CC heart development and function. Acts as a transcriptional
CC repressor of ANF by binding to both GATA4 and NKX2-5 and
CC repressing their transcriptional activator activities.
CC Participates in the negative regulation of cell proliferation
CC signaling.
CC -1- SUBUNIT: Interacts with the N-terminal region of GATA4 and the C-
CC terminal region of the NKX2-5 homeobox and represses their ability
CC to activate transcription of ANF.
CC -1- INTERACTION:
CC Q8369:Gata4; NbExp=2; IntAct=EBI-493592, EBI-297008;
CC P42582:NKX2-5; NbExp=2; IntAct=EBI-493592, EBI-297021;
CC -1- SUBCELLULAR LOCATION: Nuclear.
CC -1- TISSUE SPECIFICITY: Widely expressed in embryos. In adults,
CC expressed at high levels in heart, skeletal muscle, brain and
CC thymus.
CC -1- SIMILARITY: Contains 1 ARID domain.
CC -1- SIMILARITY: Contains 1 JmJC domain.
CC -1- SIMILARITY: Contains 1 JmJN domain.

CC The present sequence is a peptide which binds to thrombopoietin (TPO)
 CC receptor (TR). The compound can be used for treating patients suffering
 CC from haematological disorders and thrombocytopenia resulting from
 CC chemotherapy, radiation therapy or bone marrow transfusions. The peptide
 CC may also be used to maintain the proliferation and growth of TPO-
 CC dependent cell lines and for use in biological research, for detecting
 CC TPO receptors on living cells

 DR Novel composition of matter comprising an Fc domain and pharmacologically
 PT active peptides, useful for treating cancer and autoimmune diseases.
 XX Claim 19; Page 212; 608pp; English.

The present invention describes composition of matter (I) comprising an
 Fc domain, pharmacologically active peptides, and linkers. Where (I) is:
 (X1)a-P1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each
 independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, -(L1)c-P1-
 (L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2,
 P3, and P4 = are each independently sequences of pharmacologically active
 peptides; L1, L2, L3, and L4 = are each independently linker; and a, b,
 c, d, e, and f = are each independently 0 or 1, provided that at least 1
 of a and b is 1. The composition can have cytostatic, antiasthmatic,
 thrombolytic and immunosuppressive activities. DNAs, vectors and host
 cells from the present invention can be used for producing pharmaceutical
 compositions. The compositions are useful for treating cancer, asthma,
 thrombosis, or autoimmune diseases. The use of an Fc domain (rather than
 a Fab domain) can provide a longer half-life or incorporate functions
 such as Fc receptor binding, protein A binding, complement fixation, and
 possibly placental transfer. AAB69443 to AAB69526 and AAB16955 to
 AAB18003 represent nucleotide and amino acid sequences used in the
 exemplification of the present invention

 DR Activating thrombopoietin receptors in cells, used to treat
 XX thrombocytopenia and hematological disorders, comprises contacting cells
 PT with peptides and peptide mimetics attached to hydrophilic polymers.
 XX Disclosure; Col 21; 128pp; English.

Sequences AAU25815-AAU26049 represent peptides and peptide mimetics that
 bind to and activate the human thrombopoietin receptor (TPO-R). Methods
 of activating thrombopoietin receptors in cells comprise contacting the
 cells with effective amounts of peptides and peptide mimetics attached to
 hydrophilic polymers. The methods are used to treat thrombocytopenia such
 as that due to chemotherapy, radiation therapy or bone-marrow
 transplantation and to prevent thrombocytopenia in patients at risk. The
 sequences are used to treat and prevent hematological disorders
 including thrombocytopenia and platelet disorders. They are used in vitro
 as unique tools for understanding the biological role of thrombopoietin
 (TPO) and to develop other compounds that bind to and activate the TPO
 receptor. The peptides can be used to detect TPO receptors on living
 cells and fixed cells, in biological fluids, in tissue homogenates, and
 in purified or natural biological materials. They may also be used for in
 situ staining, fluorescence-activated cell sorting, Western blotting and
 enzyme-linked immunosorbent assay (ELISA). In addition, the peptides can
 be used for in vitro expansion of megakaryocytes and their committed
 progenitors alone or in conjunction with additional cytokines

DR Novel vehicle-peptide molecule or its multimers useful for treating inflammatory and autoimmune diseases, cancer, rheumatoid arthritis, diabetic retinopathy, obesity, sleep disorders and infertility.

XX

PS Claim 39; Page 43; 176pp; English.

XX

CC The present invention describes a vehicle-peptide molecule (I) or its multimers. (I) can have antiinflammatory, antitumour, immunosuppressive, cycostatic, antirheumatic, antiarthritic, antidiabetic, ophthalmological, antianemic, anorectic, antiinfertility, haemostatic, dermatological and neuroprotective activities. (I) can be used as a therapeutic or prophylactic agent as well as for screening purposes. (I) is useful for diagnosing diseases characterised by dysfunction of their associated protein of interest, for identifying normal or abnormal proteins of interest, as a part of diagnostic kit to detect the presence of their proteins of interest in a biological sample. Additionally, (I) is useful for treating inflammatory and autoimmune diseases, tumour growth, cancer, rheumatoid arthritis, diabetic retinopathy, obesity, sleep disorders, EPO-inertility, and neurological degenerative diseases. (I), comprising EPO-mimetic compounds are useful for treating disorders characterised by low red blood cell levels such as anaemia. The TPO-mimetic comprising compounds are useful for treating conditions that involve an existing megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet deficiency, such as thrombocytopaenia, aplastic anaemia, metastatic tumour which result in thrombocytopaenia, systemic lupus erythematosus, and Fanconi's syndrome. ABB72403 to ABB73426 and ABL35695 to ABL35777 represent amino acid and nucleic acid sequences used in the exemplification of the present invention

DR New CDR mimetibody comprising a portion of a heavy or light chain variable region comprising human framework or ligand binding region, useful for preparing a composition for treating e.g., immune, cardiovascular or neurologic disease.

XX

PS Disclosure; SEQ ID NO 484; 97pp; English.

XX

CC This invention relates to novel mammalian CDR mimetibodies, specific portions or variants thereof. Specifically, it refers to an antibody fragment where a protein has been inserted into, or replaces a portion of, one or more CDR regions, such that each CDR mimetibody comprises at least one portion of a heavy chain or light chain variable region, which itself comprises at least one human framework region and at least one ligand binding region (LBR). The present invention describes human mimetibodies, including modified immunoglobulins and cleavage products that can be useful in gene therapy and the generation of transgenic plants and animals. Furthermore, the CDR mimetibody is useful for preparing compositions for modulating, treating or reducing the symptoms of immune, cardiovascular, infectious, malignant and/or neurologic diseases, as well as anaemia. Accordingly, they exhibit immunomodulator, cardiant, antimicrobial, cytostatic and neuroprotective activities. This peptide sequence is a TPO mimetic peptide sequence used to make a mimetibody of the invention.

XX This invention relates to CHI deleted mimetibodies (and the DNA sequences
CC which encode them), compositions, methods and uses. The invention may be
CC useful for the development of compounds with an immunosuppressive,
CC cardiovascular, cardiant, hypotensive, neuroprotective, nootropic,
CC antibacterial, virucide or fungicide activity. In addition, the disclosed
CC sequences may prove useful for gene therapy. The CHI-deleted mimetibody
CC is useful for diagnosing or treating a disease condition in a cell,
CC tissue, organ or animal, specifically for modulating, treating,
CC alleviating, preventing the incidence or reducing the symptoms of an
CC immune, cardiovascular (for example arrhythmia, hypertension or heart
CC failure), or neurodegenerative (for example multiple sclerosis, dementia
CC or Alzheimer's disease) diseases or disorders, anaemia, cancerous
CC conditions, or infectious diseases (for example bacterial, viral or
CC fungal infection). The present sequence is that of a peptide which may be
CC used during the creation of a mimetibody of the invention.

XX Thrombopoietin receptor-binding/activating peptide(s) and peptide

PT mimetic(s) - useful in treatment of haematological disorders, esp.

PT thrombocytopenia resulting from chemotherapy, etc.

PS Claim 23; Page 90; 106pp; English.

XX The present sequence is a compound which binds to thrombopoietin (TPO)
 CC receptor (TR). It has a molecular weight of < 8000 Da, and a binding
 CC affinity to TR as expressed by an IC50 of no more than about 100 nm. The
 CC compound can be used for treating patients suffering from haematological
 CC disorders and thrombocytopenia resulting from chemotherapy, radiation
 CC therapy or bone marrow transfusions. The peptide may also be used to
 CC maintain the proliferation and growth of TPO-dependent cell lines and for
 CC use in biological research, for detecting TPO receptors on living cells.
 CC The present sequence is a specifically claimed example of a compound that
 CC is administered to a patient suffering from a disorder that is
 CC susceptible to treatment with a thrombopoietin agonist

XX Peptides and peptide mimetics which bind to and activate the
 PT thrombopoietin receptor - useful in treatment of haematological
 PT disorders, esp. thrombocytopenia resulting from chemotherapy, etc.

XX Claim 14; Page 89; 106pp; English.

XX The present peptide binds the thrombopoietin receptor (TR), has a
 CC molecular weight of less than 8000 Da and a TR binding affinity as
 CC expressed by an IC50 of no more than about 100 microm. It can be used to
 CC treat disorders which are susceptible to treatment with a thrombopoietin
 CC agonist, preferably haematological disorders and thrombocytopenia
 CC resulting from chemotherapy, radiation therapy or bone marrow
 CC transfusions. It can also be used diagnostically, e.g. to investigate the
 CC mechanism of thrombopoietin signal transduction and receptor activation,
 CC or to maintain the proliferation and growth of thrombopoietin dependent
 CC cell lines

 Novel composition of matter comprising an Fc domain and pharmacologically
 active peptides, useful for treating cancer and autoimmune diseases.
 Claim 19; Page 220; 608pp; English.
 The present invention describes composition of matter (I) comprising an
 Fc domain, pharmacologically active peptides, and linkers. Where (I) is:
 (X1)a-P1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each
 independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, -(L1)c-P1-
 (L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2,
 P3, and P4 = are each independently sequences of pharmacologically active
 peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b,
 c, d, e, and f = are each independently 0 or 1, provided that at least 1
 of a and b is 1. The composition can have cytostatic, antiasthmatic,
 thrombolytic and immunosuppressive activities. DNAs, vectors and host
 cells from the present invention can be used for producing pharmaceutical
 compositions. The compositions are useful for treating cancer, asthma,
 thrombosis, or autoimmune diseases. The use of an Fc domain (rather than
 a Fab domain) can provide a longer half-life or incorporate functions
 such as Fc receptor binding, protein A binding, complement fixation, and
 possibly placental transfer. AA69443 to AA69526 and AAB16955 to
 AAB18003 represent nucleotide and amino acid sequences used in the
 exemplification of the present invention

 Activating thrombopoietin receptors in cells, used to treat
 thrombocytopenia and hematological disorders, comprises contacting cells
 with peptides and peptide mimetics attached to hydrophilic polymers.
 Disclosure; Col 69-70; 128pp; English.
 Sequences AAU25815-AAU26049 represent peptides and peptide mimetics that
 bind to and activate the human thrombopoietin receptor (TPO-R). Methods
 of activating thrombopoietin receptors in cells comprise contacting the
 cells with effective amounts of peptides and peptide mimetics attached to
 hydrophilic polymers. The methods are used to treat thrombocytopenia such
 as that due to chemotherapy, radiation therapy or bone-marrow
 transplantation and to prevent thrombocytopenia in patients at risk. The
 sequences are used to treat and prevent hematological disorders
 including thrombocytopenia and platelet disorders. They are used in vitro
 as unique tools for understanding the biological role of thrombopoietin
 (TPO) and to develop other compounds that bind to and activate the TPO
 receptor. The peptides can be used to detect TPO receptors on living
 cells and fixed cells, in biological fluids, in tissue homogenates, and
 in purified or natural biological materials. They may also be used for in
 situ staining, fluorescence-activated cell sorting, Western blotting and
 enzyme-linked immunosorbent assay (ELISA). In addition, the peptides can
 be used for in vitro expansion of megakaryocytes and their committed
 progenitors alone or in conjunction with additional cytokines

XX PS Claim 39; Page 44; 176pp; English.
XX
XX CC The present invention describes a vehicle-peptide molecule (I) or its
XX multimers. (I) can have antiinflammatory, antitumour, immunosuppressive,
XX cytostatic, antirheumatic, antiarthritic, antidiabetic, ophthalmological,
XX antinaemic, anorectic, antiinfertility, haemostatic, dermatological and
XX neuroprotective activities. (I) can be used as a therapeutic or
XX prophylactic agent as well as for screening purposes. (I) is useful for
XX diagnosing diseases characterised by dysfunction of their associated
XX protein of interest, for identifying normal or abnormal proteins of
XX interest, as a part of diagnostic kit to detect the presence of their
XX proteins of interest in a biological sample. Additionally, (I) is useful
XX for treating inflammatory and autoimmune diseases, tumour growth, cancer,
XX rheumatoid arthritis, diabetic retinopathy, obesity, sleep disorders,
XX infertility, and neurological degenerative diseases. (I), comprising EPO-
XX mimetic compounds are useful for treating disorders characterised by low
XX red blood cell levels such as anaemia. The TPO-mimetic comprising
XX compounds are useful for treating conditions that involve an existing
XX megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet
XX deficiency, such as thrombocytopenia, aplastic anaemia, metastatic
XX tumour which result in thrombocytopenia, systemic lupus erythematosus,
XX and Fanconi's syndrome. ABB72403 to ABB73426 and ABL35695 to ABL35777

XX PT New CDR mimetibody comprising a portion of a heavy or light chain
XX variable region comprising human framework or ligand binding region,
XX useful for preparing a composition for treating e.g., immune,
XX cardiovascular or neurologic disease.
XX
XX PS Disclosure; SEQ ID NO 511; 97pp; English.
XX
XX CC This invention relates to novel mammalian CDR mimetibodies, specific
XX portions or variants thereof. Specifically, it refers to an antibody
XX fragment where a protein has been inserted into, or replaces a portion
XX of, one or more CDR regions, such that each CDR mimetibody comprises at
XX least one portion of a heavy chain or light chain variable region, which
XX itself comprises at least one human framework region and at least one
XX ligand binding region (LBR). The present invention describes human
XX mimetibodies, including modified immunoglobulins and cleavage products
XX that can be useful in gene therapy and the generation of transgenic
XX plants and animals. Furthermore, the CDR mimetibody is useful for
XX preparing compositions for modulating, treating or reducing the symptoms
XX of immune, cardiovascular, infectious, malignant and/or neurologic
XX diseases, as well as anaemia. Accordingly, they exhibit immunomodulator,
XX cardiant, antimicrobial, cytostatic and neuroprotective activities. This
XX peptide sequence is a TPO mimetic peptide sequence used to make a
XX mimetibody of the invention.

 XX PT Novel composition of matter comprising an Fc domain and pharmacologically
 active peptides, useful for treating cancer and autoimmune diseases.
 XX PS Claim 19; Page 212; 608pp; English.

CC The present invention describes composition of matter (I) comprising an
 CC Fc domain, pharmacologically active peptides, and linkers. Where (I) is:
 CC (X1)-a-P1-(X2)b, where: P1 = an Fc domain; X1 and X2 = are each
 CC independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, -(L1)c-P1-
 CC (L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2,
 CC P3, and P4 = are each independently sequences of pharmacologically active
 CC peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b,
 CC c, d, e, and f = are each independently 0 or 1, provided that at least 1
 CC of a and b is 1. The composition can have cytostatic, antiasthmatic,
 CC thrombolytic and immunosuppressive activities. DNAs, vectors and host
 CC cells from the present invention can be used for producing pharmaceutical
 CC compositions. The compositions are useful for treating cancer, asthma,
 CC thrombosis, or autoimmune diseases. The use of an Fc domain (rather than
 CC a Fab domain) can provide a longer half-life or incorporate functions
 CC such as Fc receptor binding, protein A binding, complement fixation, and
 CC possibly placental transfer. AAG4943 to AAG69526 and AAB16955 to
 CC AAB18003 represent nucleotide and amino acid sequences used in the
 CC exemplification of the present invention

XX PT New CDR mimetibody comprising a portion of a heavy or light chain
PT variable region comprising human framework or ligand binding region,
PT useful for preparing a composition for treating e.g., immune,
PT cardiovascular or neurologic disease.
XX PS Disclosure; SEQ ID NO 485; 97pp; English.
XX CC This invention relates to novel mammalian CDR mimetibodies, specific
CC portions or variants thereof. Specifically, it refers to an antibody
CC fragment where a protein has been inserted into, or replaces a portion
CC of, one or more CDR regions, such that each CDR mimetibody comprises at
CC least one portion of a heavy chain or light chain variable region, which
CC itself comprises at least one human framework region and at least one
CC ligand binding region (LBR). The present invention describes human
CC mimetibodies, including modified immunoglobulins and cleavage products
CC that can be useful in gene therapy and the generation of transgenic
CC plants and animals. Furthermore, the CDR mimetibody is useful for
CC preparing compositions for modulating, treating or reducing the symptoms
CC of immune, cardiovascular, infectious, malignant and/or neurologic
CC diseases, as well as anaemia. Accordingly, they exhibit immunomodulator,
CC cardiac, antimicrobial, cytostatic and neuroprotective activities. This
CC peptide sequence is a TPO mimetic peptide sequence used to make a
CC mimetibody of the invention.

XX PT Novel vehicle-peptide molecule or its multimers useful for treating
PT inflammatory and autoimmune diseases, cancer, rheumatoid arthritis,
PT diabetic retinopathy, obesity, sleep disorders and infertility.
XX PS Claim 39; Page 43; 176pp; English.
XX CC The present invention describes a vehicle-peptide molecule (I) or its
CC multimers. (I) can have antiinflammatory, antitumour, immunosuppressive,
CC cytostatic, antirheumatic, antiarthritic, antidiabetic, ophthalmological,
CC antianaemic, anorectic, antiinfertility, haemostatic, dermatological and
CC neuroprotective activities. (I) can be used as a therapeutic or
CC prophylactic agent as well as for screening purposes. (I) is useful for
CC diagnosing diseases characterised by dysfunction of their associated
CC protein of interest, for identifying normal or abnormal proteins of
CC interest, as a part of diagnostic kit to detect the presence of their
CC proteins of interest in a biological sample. Additionally, (I) is useful
CC for treating inflammatory and autoimmune diseases, tumour growth, cancer,
CC rheumatoid arthritis, diabetic retinopathy, obesity, sleep disorders,
CC infertility, and neurological degenerative diseases. (I), comprising EPO-
CC mimetic compounds are useful for treating disorders characterised by low
CC red blood cell levels, such as anaemia. The TPO-mimetic comprising
CC megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet

XX PT New CHI-deleted mimetibody polypeptides and nucleic acids, useful for
modulating, treating, alleviating, preventing an immune, cardiovascular,
or neurodegenerative disease or disorder, anemia, cancer, or infectious
diseases.

XX PS Claim 2; SEQ ID NO 485; 129pp; English.

XX CC This invention relates to CHI deleted mimetibodies (and the DNA sequences
which encode them), compositions, methods and uses. The invention may be
useful for the development of compounds with an immunosuppressive,
cardiovascular, cardiant, hypotensive, neuroprotective, nootropic,
antibacterial, virucide or fungicide activity. In addition, the disclosed
sequences may prove useful for gene therapy. The CHI-deleted mimetibody
is useful for diagnosing or treating a disease condition in a cell,
tissue, organ or animal, specifically for modulating, treating,
alleviating, preventing the incidence or reducing the symptoms of an
immune, cardiovascular (for example arrhythmia, hypertension or heart
failure), or neurodegenerative (for example multiple sclerosis, dementia
or Alzheimer's disease) diseases or disorders, anaemia, cancerous
conditions, or infectious diseases (for example bacterial, viral or
fungal infection). The present sequence is that of a peptide which may be
used during the creation of a mimetibody of the invention.

XX PT New CHI deleted mimetibody polypeptide and nucleic acid, useful for
diagnosing, preventing or treating cardiovascular, dermatologic,
endocrine, gastrointestinal, gynecologic, infectious, neurologic and
nutritional disorders.

XX PS Claim 14; SEQ ID NO 485; 123pp; English.

XX CC This invention relates to CHI deleted mimetibodies (and the DNA sequences
which encode them), compositions, methods and uses. The invention may be
useful for the development of compounds with an osteopathic,
cardiovascular-Gen, dermatological-Gen, auditory, endocrine-Gen,
gastrointestinal-Gen, gynaecological-Gen, hepatotropic, haemostatic,
immunomodulator, anti-allergic, muscular-Gen, cytostatic,
anti-inflammatory, neuroleptic, ophthalmological, nephrotropic or
respiratory-Gen activity acting as a tumour necrosis factor (TNF) -
modulator or cytokine-agonist. The methods and compositions of the
present invention are useful for the diagnosis, prevention and/or
treatment of diseases or conditions associated with aberrant expression
or activity of the CHI deleted mimetibody, such as a bone or joint,
cardiovascular, dental or oral, dermatological, ear, nose or throat,
endocrine, metabolic, gastrointestinal, gynaecological, hepatic,
obstetric, haematologic, immunological, allergic, infectious,

CC musculoskeletal, oncological, neurological, nutritional, ophthalmologic,
 CC pediatric, psychiatric, renal or pulmonary disorders. The present
 CC sequence is that of a peptide which may be used during the creation of a
 CC mimetibody of the invention.

XX PT Activating thrombopoietin receptors in cells, used to treat
 PT thrombocytopenia and hematological disorders, comprises contacting cells
 PT with peptides and peptide mimetics attached to hydrophilic polymers.

XX PS Disclosure; Col 22; 128pp; English.

XX SQ Sequences AAW25815-AAU26049 represent peptides and peptide mimetics that
 CC bind to and activate the human thrombopoietin receptor (TPO-R). Methods
 CC of activating thrombopoietin receptors in cells comprise contacting the
 CC cells with effective amounts of peptides and peptide mimetics attached to
 CC hydrophilic polymers. The methods are used to treat thrombocytopenia such
 CC as that due to chemotherapy, radiation therapy or bone marrow
 CC transplantation and to prevent thrombocytopenia in patients at risk. The
 CC sequences are used to treat and prevent haematological disorders
 CC including thrombocytopenia and platelet disorders. They are used in vitro
 CC as unique tools for understanding the biological role of thrombopoietin
 CC (TPO) and to develop other compounds that bind to and activate the TPO
 CC receptor. The peptides can be used to detect TPO receptors on living
 CC cells and fixed cells, in biological fluids, in tissue homogenates, and
 CC in purified or natural biological materials. They may also be used for in
 CC situ staining, fluorescence-activated cell sorting, Western blotting and
 CC enzyme-linked immunosorbent assay (ELISA). In addition, the peptides can
 CC be used for in vitro expansion of megakaryocytes and their committed
 CC progenitors alone or in conjunction with additional cytokines

 XX Novel composition of matter comprising an Fc domain and pharmacologically

PT active peptides, useful for treating cancer and autoimmune diseases.

PS Claim 19; Page 214; 608pp; English.

XX The present invention describes composition of matter (I) comprising an

CC Fc domain, pharmacologically active peptides, and linkers. Where (I) is:

CC (X1)-a-P1-(X2)b, where: P1 = an Fc domain; X1 and X2 = are each

CC independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, -(L1)c-P1-

CC (L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2,

CC P3, and P4 = are each independently sequences of pharmacologically active

CC peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b,

CC c, d, e, and f = are each independently 0 or 1, provided that at least 1

CC of a and b is 1. The composition can have cytotoxic, antiaesthetic,

CC thrombolytic and immunosuppressive activities. DNAs, vectors and host

CC cells from the present invention can be used for producing pharmaceutical

CC compositions. The compositions are useful for treating cancer, asthma,

CC thrombosis, or autoimmune diseases. The use of an Fc domain (rather than

CC a Fab domain) can provide a longer half-life or incorporate functions

CC such as Fc receptor binding, protein A binding, complement fixation, and

CC possibly placental transfer. AAA69443 to AAA69526 and AAA16955 to

CC AAA18003 represent nucleotide and amino acid sequences used in the

CC exemplification of the present invention

XX Novel vehicle-peptide molecule or its multimers useful for treating

PT inflammatory and autoimmune diseases, cancer, rheumatoid arthritis,

PT diabetic retinopathy, obesity, sleep disorders and infertility.

XX Claim 39; Page 43; 176pp; English.

XX The present invention describes a vehicle-peptide molecule (I) or its

CC multimers. (I) can have antiinflammatory, antitumour, immunosuppressive,

CC cytostatic, antirheumatic, antiarthritis, antidiabetic, ophthalmological,

CC antianaemic, anorectic, antifertility, haemostatic, dermatological and

CC neuroprotective activities. (I) can be used as a therapeutic or

CC prophylactic agent as well as for screening purposes. (I) is useful for

CC diagnosing diseases characterised by dysfunction of their associated

CC protein of interest, for identifying normal or abnormal proteins of

CC interest, as a part of diagnostic kit to detect the presence of their

CC proteins of interest in a biological sample. Additionally, (I) is useful

CC for treating inflammatory and autoimmune diseases, tumour growth, cancer,

CC rheumatoid arthritis, diabetic retinopathy, obesity, sleep disorders,

CC infertility and neurological degenerative diseases. (I), comprising EPO-

CC mimetic compounds are useful for treating disorders characterised by low

CC red blood cell levels such as anaemia. The EPO-mimetic comprising

CC compounds are useful for treating conditions that involve an existing

CC megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet

CC deficiency, such as thrombocytopenia, aplastic anaemia, metastatic

CC tumour which result in thrombocytopenia, systemic lupus erythematosus,

CC and Fanconi's syndrome. ABB72403 to ABB73426 and ABL35695 to ABL35777

XX
XX New CHI-deleted mimetibody polypeptides and nucleic acids, useful for
PT modulating, treating, alleviating, preventing an immune, cardiovascular,
PT or neurodegenerative disease or disorder, anemia, cancer, or infectious
PT diseases.
XX
XX Claim 2; SEQ ID NO 493; 129pp; English.
XX
XX This invention relates to CHI deleted mimetibodies (and the DNA sequences
CC which encode them), compositions, methods and uses. The invention may be
CC useful for the development of compounds with an immunosuppressive,
CC cardiovascular, cardiac, hypotensive, neuroprotective, nootropic,
CC antibacterial, virucide or fungicide activity. In addition, the disclosed
CC sequences may prove useful for gene therapy. The CHI-deleted mimetibody
CC is useful for diagnosing or treating a disease condition in a cell,
CC tissue, organ or animal, specifically for modulating, treating,
CC alleviating, preventing the incidence or reducing the symptoms of an
CC immune, cardiovascular (for example arrhythmia, hypertension or heart
CC failure), or neurodegenerative (for example multiple sclerosis, dementia
CC or Alzheimer's disease) diseases or disorders, anaemia, cancerous
CC conditions, or infectious diseases (for example bacterial, viral or
CC fungal infection). The present sequence is that of a peptide which may be
CC used during the creation of a mimetibody of the invention.

PT diagnosing, preventing or treating cardiovascular, dermatologic,
PT endocrine, gastrointestinal, gynecologic, infectious, neurologic and
PT nutritional disorders.
XX
XX Claim 14; SEQ ID NO 493; 123pp; English.
XX
XX This invention relates to CHI deleted mimetibodies (and the DNA sequences
CC which encode them), compositions, methods and uses. The invention may be
CC useful for the development of compounds with an osteopathic,
CC cardiovascular-Gen, dermatological-Gen, auditory, endocrine-Gen,
CC gastrointestinal-Gen, gynaecological-Gen, hepatotropic, haemostatic,
CC immunomodulator, antiallergic, muscular-Gen, cytostatic,
CC antiinflammatory, neuroleptic, ophthalmological, nephrotropic or
CC respiratory-Gen activity acting as a tumour necrosis factor (TNF) -
CC modulator or cytokine-agonist. The methods and compositions of the
CC present invention are useful for the diagnosis, prevention and/or
CC treatment of diseases or conditions associated with aberrant expression
CC or activity of the CHI deleted mimetibody, such as a bone or joint,
CC cardiovascular, dental or oral, dermatological, ear, nose or throat,
CC endocrine, metabolic, gastrointestinal, gynaecological, hepatic,
CC obstetric, haematologic, immunological, allergic, infectious,
CC musculoskeletal, oncological, neurological, nutritional, ophthalmologic,
CC pediatric, psychiatric, renal or pulmonary disorders. The present
CC sequence is that of a peptide which may be used during the creation of a
CC mimetibody of the invention.

PT Novel composition of matter comprising an Fc domain and pharmacologically
PT active peptides, useful for treating cancer and autoimmune diseases.
XX
PS Claim 19; Page 211; 609pp; English.
XX
CC The present invention describes composition of matter (I) comprising an
CC Fc domain, pharmacologically active peptides, and linkers. Where (I) is:
CC (X1)a-P1-(X2)b, where: P1 = an Fc domain; X1 and X2 = are each
CC independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, -(L1)c-P1-
CC (L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2,
CC P3, and P4 = are each independently sequences of pharmacologically active
CC peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b,
CC c, d, e, and f = are each independently 0 or 1, provided that at least 1
CC of a and b is 1. The composition can have cytostatic, antiasthmatic,
CC thrombolytic and immunosuppressive activities. DNAs, vectors and host
CC cells from the present invention can be used for producing pharmaceutical
CC compositions. The compositions are useful for treating cancer, asthma,
CC thrombosis, or autoimmune diseases. The use of an Fc domain (rather than
CC a Fab domain) can provide a longer half-life or incorporate functions
CC such as Fc receptor binding, protein A binding, complement fixation, and
CC possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to
CC AAB18003 represent nucleotide and amino acid sequences used in the
CC exemplification of the present invention

XX inflammatory and autoimmune diseases, cancer, rheumatoid arthritis,
XX diabetic retinopathy, obesity, sleep disorders and infertility.
XX
PS Claim 39; Page 43; 176pp; English.
XX
CC The present invention describes a vehicle-peptide molecule (I) or its
CC multimers. (I) can have antiinflammatory, antitumour, immunosuppressive,
CC cytostatic, antirheumatic, antiarthritic, antidiabetic, ophthalmological,
CC antianemic, anorectic, antiinfertility, haemostatic, dermatological and
CC neuroprotective activities. (I) can be used as a therapeutic or
CC prophylactic agent as well as for screening purposes. (I) is useful for
CC diagnosing diseases characterised by dysfunction of their associated
CC protein of interest, for identifying normal or abnormal proteins of
CC interest, as a part of diagnostic kit to detect the presence of their
CC proteins of interest in a biological sample. Additionally, (I) is useful
CC for treating inflammatory and autoimmune diseases, tumour growth, cancer,
CC rheumatoid arthritis, diabetic retinopathy, obesity, sleep disorders,
CC infertility, and neurological degenerative diseases. (I), comprising EPO-
CC mimetic compounds are useful for treating disorders characterised by low
CC red blood cell levels such as anaemia. The TPO-mimetic comprising
CC compounds are useful for treating conditions that involve an existing
CC megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet
CC deficiency, such as thrombocytopaenia, aplastic anaemia, metastatic
CC tumour which result in thrombocytopaenia, systemic lupus erythematosus,
CC and Fanconi's syndrome. ABB72403 to ABB73426 and ABL35695 to ABL35777
CC represent amino acid and nucleic acid sequences used in the
CC exemplification of the present invention

DR New CDR mimetibody comprising a portion of a heavy or light chain
XX variable region comprising human framework or ligand binding region,
XX useful for preparing a composition for treating e.g., immune,
XX cardiovascular or neurologic disease.
XX
PS Disclosure; SEQ ID NO 481; 97pp; English.
XX
CC This invention relates to novel mammalian CDR mimetibodies, specific
CC portions or variants thereof. Specifically, it refers to an antibody
CC fragment where a protein has been inserted into, or replaces a portion
CC of, one or more CDR regions, such that each CDR mimetibody comprises at
CC least one portion of a heavy chain or light chain variable region, which
CC itself comprises at least one human framework region and at least one
CC ligand binding region (LBR). The present invention describes human
CC mimetibodies, including modified immunoglobulins and cleavage products
CC that can be useful in gene therapy and the generation of transgenic
CC plants and animals. Furthermore, the CDR mimetibody is useful for
CC preparing compositions for modulating, treating or reducing the symptoms
CC of immune, cardiovascular, infectious, malignant and/or neurologic
CC diseases, as well as anaemia. Accordingly, they exhibit immunomodulator,
CC cardiant, antimicrobial, cytostatic and neuroprotective activities. This
CC peptide sequence is a TPO mimetic peptide sequence used to make a
CC mimetibody of the invention.

 XX
 XX New CHI-deleted mimetibody polypeptides and nucleic acids, useful for
 PT modulating, treating, alleviating, preventing an immune, cardiovascular,
 PT or neurodegenerative disease or disorder, anemia, cancer, or infectious
 PT diseases.
 XX
 PS Claim 2; SEQ ID NO 481; 129pp; English.
 XX
 CC This invention relates to CHI deleted mimetibodies (and the DNA sequences
 CC which encode them), compositions, methods and uses. The invention may be
 CC useful for the development of compounds with an immunosuppressive,
 CC cardiovascular, cardiac, hypotensive, neuroprotective, notropic,
 CC antibacterial, viricide or fungicide activity. In addition, the disclosed
 CC sequences may prove useful for gene therapy. The CHI-deleted mimetibody
 CC is useful for diagnosing or treating a disease condition in a cell,
 CC tissue, organ or animal, specifically for modulating, treating,
 CC alleviating, preventing the incidence or reducing the symptoms of an
 CC immune, cardiovascular (for example arrhythmia, hypertension or heart
 CC failure), or neurodegenerative (for example multiple sclerosis, dementia
 CC or Alzheimer's disease) diseases or disorders, anaemia, cancerous
 CC conditions, or infectious diseases (for example bacterial, viral or
 CC fungal infection). The present sequence is that of a peptide which may be
 CC used during the creation of a mimetibody of the invention.

Peptides and peptide mimetics which bind to and activate the
thrombopoietin receptor - useful in treatment of haematological
disorders, esp. thrombocytopenia resulting from chemotherapy, etc.
Disclosure; Page 27; 106pp; English.
The present peptide, which binds the thrombopoietin receptor (TR), can be
used to treat disorders which are susceptible to treatment with a
thrombopoietin agonist, preferably haematological disorders and
thrombocytopenia resulting from chemotherapy, radiation therapy or bone
marrow transfusions. It can also be used diagnostically, e.g. to
investigate the mechanism of thrombopoietin signal transduction and
receptor activation, or to maintain the proliferation and growth of
thrombopoietin dependent cell lines

RT "X-ray structure of azide-bound fully oxidized cytochrome c oxidase
RT from bovine heart at 2.9 A resolution.";
RL Acta Crystallogr. D 56:529-535(2000).
CC -!- FUNCTION: This protein is one of the nuclear-coded polypeptide
CC chains of cytochrome c oxidase, the terminal oxidase in
CC mitochondrial electron transport.
CC -!- CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome
CC c + 2 H(2)O.
CC -!- SUBCELLULAR LOCATION: Mitochondrial inner membrane.
CC -!- TISSUE SPECIFICITY: Heart/muscle specific isoform.
CC -!- SIMILARITY: Belongs to the cytochrome c oxidase Via family.
CC -----
CC This Swiss-Prot entry is copyright. It is produced through a collaboration
CC between the Swiss Institute of Bioinformatics and the EMBL outstation -
CC the European Bioinformatics Institute. There are no restrictions on its
CC use as long as its content is in no way modified and this statement is not
CC removed.

CC -!- FUNCTION: Involved in degradation of small peptides. Digests
CC preferentially peptides containing an aliphatic or hydrophobic
CC residue in P1' position, as well as methionine, leucine or
CC phenylalanine in P1 position of ester substrate.
CC -!- CATALYTIC ACTIVITY: Release of a C-terminal amino acid with broad
CC specificity.
CC -!- ENZYME REGULATION: Inhibited by ZPCK.
CC -!- SUBCELLULAR LOCATION: Lysosome-like vacuoles.
CC -!- PTM: Enters the endoplasmic reticulum as an inactive zymogen and
CC is modified by four N-linked core oligosaccharides, giving rise to
CC a precursor known as P1 (67 kDa). As P1 transits through the
CC Golgi, extension of its core oligosaccharides leads to the Golgi-
CC modified P2 precursor (69 kDa). P2 is sorted away from secretory
CC proteins at or beyond a late Golgi compartment and is subsequently
CC delivered to the vacuole via a prevacuolar endosome-like
CC compartment. Upon arrival in the vacuole, the N-terminal
CC prosegment of P2 is cleaved to yield the enzymatically active
CC mature vacuolar form of CPY (61 kDa).
CC -!- SIMILARITY: Belongs to the peptidase S10 family.
CC -!- DATABASE: NAME=Worthington enzyme manual;
CC WWW="http://www.worthington-biochem.com/COY/".

 RA Okazaki M., Ueshima R.;
 RA Submitted (JUL-2001) to the EMBL/GenBank/DBJ databases.
 RL -1- FUNCTION: Component of the ubiquinol-cytochrome c reductase
 CC complex (complex III or cytochrome b-c1 complex), which is a
 CC respiratory chain that generates an electrochemical potential
 CC coupled to ATP synthesis (By similarity).
 CC -1- COFACTOR: Binds 2 heme groups noncovalently (By similarity).
 CC -1- SUBUNIT: The main subunits of complex b-c1 are: cytochrome b,
 CC cytochrome c1 and the Rieske protein (By similarity).
 CC -1- SIMILARITY: Belongs to the cytochrome b family.

CC -!- FUNCTION: Reverses the normal flow of glycerolipid biosynthesis by
CC phosphorylating diacylglycerol back to phosphatidic acid.
CC -!- CATALYTIC ACTIVITY: ATP + 1,2-diacylglycerol = ADP + 1,2-diacyl-
CC sn-glycerol 3-phosphate.
CC -!- ENZYME REGULATION: Requires phosphatidylserine for maximal
CC activity.
CC -!- SUBCELLULAR LOCATION: Cytoplasmic. Can be loosely bound to the
CC membranes.
CC -!- ALTERNATIVE PRODUCTS:
CC Event=Alternative splicing; Named isoforms=2;
CC Name=Long;
CC IsoId=P49619-1; Sequence=Displayed;
CC Name=Short;
CC IsoId=P49619-2; Sequence=VSP_001267;
CC Note=May be inactive;
CC -!- TISSUE SPECIFICITY: Predominantly expressed in retina and in a
CC much lesser extent in the brain. Other tissues contain extremely
CC low levels of DGK-gamma.
CC -!- SIMILARITY: Belongs to the eukaryotic diacylglycerol kinase
CC family.
CC -!- SIMILARITY: Contains 2 EF-hand domains.
CC -!- SIMILARITY: Contains 2 phorbol-ester/DAG-type zinc fingers.

CC The present sequence is a peptide which binds to thrombopoietin (TPO)
 CC receptor (TR). The compound can be used for treating patients suffering
 CC from haematological disorders and thrombocytopenia resulting from
 CC chemotherapy, radiation therapy or bone marrow transfusions. The peptide
 CC may also be used to maintain the proliferation and growth of TPO-
 CC dependent cell lines and for use in biological research, for detecting
 CC TPO receptors on living cells

Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and autoimmune diseases.

Claim 19; Page 213; 608pp; English.

The present invention describes composition of matter (I) comprising an Fc domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-P1-(X2)b, where: P1 = an Fc domain; X1 and X2 = are each independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, -(L1)c-P1-P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently 0 or 1, provided that at least 1 of a, e, and f is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAG69443 to AAG69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention

Activating thrombopoietin receptors in cells, used to treat thrombocytopenia and hematological disorders, comprises contacting cells with peptides and peptide mimetics attached to hydrophilic polymers.

Disclosure; Col 21; 128pp; English.

Sequences AAU25815-AAU26049 represent peptides and peptide mimetics that bind to and activate the human thrombopoietin receptor (TPO-R). Methods of activating thrombopoietin receptors in cells comprise contacting the cells with effective amounts of peptides and peptide mimetics attached to hydrophilic polymers. The methods are used to treat thrombocytopenia such as that due to chemotherapy, radiation therapy or bone-marrow transplantation and to prevent thrombocytopenia in patients at risk. The sequences are used to treat and prevent haematological disorders including thrombocytopenia and platelet disorders. They are used in vitro as unique tools for understanding the biological role of thrombopoietin (TPO) and to develop other compounds that bind to and activate the TPO receptor. The peptides can be used to detect TPO receptors on living cells and fixed cells, in biological fluids, in tissue homogenates, and in purified or natural biological materials. They may also be used for in situ staining, fluorescence-activated cell sorting, Western blotting and enzyme-linked immunosorbent assay (ELISA). In addition, the peptides can be used for in vitro expansion of megakaryocytes and their committed progenitors alone or in conjunction with additional cytokines

PT Novel vehicle-peptide molecule or its multimers useful for treating

PT inflammatory and autoimmune diseases, cancer, rheumatoid arthritis,

PT diabetic retinopathy, obesity, sleep disorders and infertility.

XX

PS Claim 39; Page 43; 176pp; English.

XX

CC The present invention describes a vehicle-peptide molecule (I) or its

CC multimers. (I) can have antiinflammatory, antitumour, immunosuppressive,

CC cycostatic, antirheumatic, antiarthritic, antidiabetic, ophthalmological,

CC antianaemic, anorectic, antiinfertility, haemostatic, dermatological and

CC neuroprotective activities. (I) can be used as a therapeutic or

CC prophylactic agent as well as for screening purposes. (I) is useful for

CC diagnosing diseases characterised by dysfunction of their associated

CC protein of interest, for identifying normal or abnormal proteins of

CC interest, as a part of diagnostic kit to detect the presence of their

CC proteins of interest in a biological sample. Additionally, (I) is useful

CC for treating inflammatory and autoimmune diseases, tumour growth, cancer,

CC rheumatoid arthritis, diabetic retinopathy, obesity, sleep disorders,

CC infertility, and neurological degenerative diseases. (I), comprising EPO-

CC mimetic compounds are useful for treating disorders characterised by low

CC red blood cell levels such as anaemia. The TPO-mimetic comprising

CC compounds are useful for treating conditions that involve an existing

CC megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet

CC deficiency, such as thrombocytopenia, aplastic anaemia, metastatic

CC tumour which result in thrombocytopenia, systemic lupus erythematosus,

CC and Fanconi's syndrome. ABB72403 to ABB73426 and ABL35695 to ABL35777

CC represent amino acid and nucleic acid sequences used in the

CC exemplification of the present invention

PT New CDR mimetibody comprising a portion of a heavy or light chain

PT variable region comprising human framework or ligand binding region,

PT useful for preparing a composition for treating e.g., immune,

PT cardiovascular or neurologic disease.

XX

PS Disclosure; SEQ ID NO 488; 97pp; English.

XX

CC This invention relates to novel mammalian CDR mimetibodies, specific

CC portions or variants thereof. Specifically, it refers to an antibody

CC fragment where a protein has been inserted into, or replaces a portion

CC of, one or more CDR regions, such that each CDR mimetibody comprises at

CC least one portion of a heavy chain or light chain variable region, which

CC itself comprises at least one human framework region and at least one

CC ligand binding region (LBR). The present invention describes human

CC mimetibodies, including modified immunoglobulins and cleavage products

CC that can be useful in gene therapy and the generation of transgenic

CC plants and animals. Furthermore, the CDR mimetibody is useful for

CC preparing compositions for modulating, treating or reducing the symptoms

CC of immune, cardiovascular, infectious, malignant and/ or neurologic

CC diseases, as well as anaemia. Accordingly, they exhibit immunomodulator,

CC cardiant, antimicrobial, cytostatic and neuroprotective activities. This

CC peptide sequence is a TPO mimetic peptide sequence used to make a

CC mimetibody of the invention.

XX
XX New recombinant DNA constructs useful in the field of biochemistry and
PT genetics, and in particular for producing transgenic plants with improved
PT biological characteristics.
XX
XX Claim 2; SEQ ID NO 10747; 14pp; English.
XX
XX The invention relates a recombinant DNA construct comprising a
CC polynucleotide having any of 5544 nucleotide sequences (CDNAs SEQ ID NO:
CC 1-5544) and encoding a polypeptide with any of 5544 amino acid sequences
CC (SEQ ID NO: 5545-11088). The CDNAs and proteins are from corn, soybean,
CC Arabidopsis, wheat and rape but the specification does not indicate which
CC sequences is derived from which organism. Also included is a method of
CC producing a plant having an improved property, comprising transforming a
CC plant with a recombinant DNA construct comprising a promoter region
CC functional in a plant cell operably joined to a polynucleotide encoding a
CC polypeptide associated with the property, and growing the transformed
CC plant. The property is selected from improving plant cold tolerance, for
CC manipulating growth rate in plant cells by modification of the cell cycle
CC pathway, for improving plant drought tolerance, for providing increased
CC resistance to plant disease, for galactomannan production, for production
CC of plant growth regulators, for improving plant heat tolerance, for
CC improving plant tolerance to herbicides, for increasing the rate of
CC homologous recombination in plants, for lignin production, for improving
CC plant tolerance to extreme osmotic conditions, for improving plant
CC tolerance to pathogens or pests, for yield improvement by modification of
CC photosynthesis, for modifying seed oil yield and/or content, for
CC modifying seed protein yield and/or content, for yield improvement by
CC modification of carbohydrate, nitrogen or phosphorus use and/or uptake
CC and for yield improvement by providing improved plant growth and
CC development under at least one stress condition. The polynucleotide may
CC also encode a plant transcription factor. The methods and compositions of

the present invention are useful in the field of biochemistry and
genetics, in particular for producing transgenic plants with improved
biological characteristics such as increased yield, improved nitrogen
flow, increasing plant tolerance to cold or heat, improving plant
tolerance to extreme osmotic and drought conditions, and improving plant
tolerance to plant pests or pathogens. They can also be used in physical
arrays of molecules, plant breeding markers, computer-based storage and
analysis systems. The present sequence is one of the 5544 plant protein
sequences of the invention. Note: The sequence data for this patent did
not form part of the printed specification, but was obtained in
CC electronic format directly from USPTO at
CC seqdata.uspto.gov/sequence.html?DocID=20040216190.

DR
XX New nucleic acid encoding ligand for topoisomerase III alpha, useful for
PT inhibiting the enzyme and in drug screening, e.g. for potential
PT anticancer agents.
XX
XX Claim 5; Page 46-47; 68pp; French.
XX
XX This shows the human topoisomerase III-alpha interacting protein (TIII-a
CC IPI). TIII-a IP has structural features in common with RNA helicases (e.g.
CC DBX1), which are involved in destruction of the nucleosome structure,
CC supercoiling of DNA, segregation of newly replicated chromosomes, and
CC recombination and stabilization of the genome. Agents that alter
CC interaction between TIII-a IP and TIII-a therefore modulate cell
CC division, replication, transcription, translation, splicing and DNA
CC recombination or repair, so may slow cell growth, block the cell cycle or
CC induce apoptosis. Antibodies and ligands of TIII-a IP are used to
CC prevent, treat or alleviate diseases that involve abnormal regulation of
CC the cell cycle, i.e. they are potential anti-tumour (cytotoxic) agents

Novel genes in the non-combining region of Y chromosome - useful to
diagnose if male infertility or reduced sperm count has a genetic basis.
XX
PS Claim 6; Fig 3A-B; 54pp; English.
XX
This represents the amino acid sequence of the Dead Box Y (DBY) gene
product. The invention relates to genes occurring on the non-recombining
region of the human Y chromosome. The sequences fall into two classes:
(1) X-homologous DNA which are expressed in many organs, having
functional X homologues and (2) testis-specific DNA sequences. Y
chromosomal DNA from males with known conditions such as infertility and
reduced sperm count can be assessed using the invention to determine
whether the condition is associated with or caused by the occurrence of
the gene or gene alteration. Candidate inhibitors of the enzymatic
activity of the genes can be assessed using in vitro assays

XX
Identifying modulators of the p53 pathway for use in treating apoptotic
or cell proliferation disorders, comprises screening for agents that
modulate activity of a human ortholog of genes that modify the p53
pathway in Drosophila.
XX
Example 2; Page 567-569; 678pp; English.
XX
The invention relates to identifying (M1) a candidate p53 pathway
modulating agent, by contacting an assay system comprising a purified HM
polypeptide (human orthologue of genes that modify the p53 pathway in
Drosophila) or nucleic acid with a test agent under conditions, where but
for the presence of the test agent, the system provides a reference
activity, and detecting a test agent-biased activity of a cell (comprising
Also included are modulating (M2) a p53 pathway of a cell (comprising
contacting a cell defective in p53 function with a candidate modulator
that specifically binds to a HM polypeptide comprising an HM amino acid
sequence, where p53 function is restored), modulating (M3) a p53 pathway
in a mammalian cell (comprising contacting the cell with an agent that
specifically binds an HM polypeptide or nucleic acid) and diagnosing (M4)
a disease in a patient (comprising: (a) obtaining a biological sample
from the patient; (b) contacting the sample with a probe for HM
expression; (c) comparing the results with a control; and (d) determining
whether the comparison indicates a likelihood disease). (M1) is useful
for identifying modulators of the p53 pathway. A probe for HM expression
is useful for diagnosing breast, colon, kidney, lung and ovarian cancer,
in a patient, where the cancer has greater than 25 % expression level.
Modulators identified by (M1) are useful in a variety of diagnostic and
therapeutic applications, where disease or disorder prognosis is related
to defects in the p53 pathway, such as, angiogenesis, apoptotic or cell
proliferation disorders (e.g. cancer). Another two new methods (M2 and
M3) are useful for modulating the p53 pathway of a cell, thus restoring
the p53 function of the cell, so that the cell undergoes normal
proliferation or progression through the cell cycle. (M2) and (M3) are
also useful for treating defects in the p53 pathway such as angiogenic,
apoptotic or cell proliferation disorders. The present sequence
represents a human p53 pathway modifying protein

XX      Combination useful for preparing a composition for treating liver
XX      disorders associated with steroid therapy, e.g., cirrhosis or hepatitis,
XX      comprising cDNAs that are differentially expressed in response to steroid
XX      treatment.
XX      Disclosure; SEQ ID NO 787; 141pp; English.
XX      The invention relates to a combination comprising cDNAs that are
XX      differentially expressed in response to steroid treatment. Also included
XX      are the following: a high throughput method for using a cDNA to detect
XX      differential expression of nucleic acids in a sample; and a high
XX      throughput method of screening molecules or compounds to identify a
XX      ligand that specifically binds a cDNA. The sample is from a subject with
XX      Wilson disease and comparison of a standard defines a stage of that
XX      disease. The high throughput method of screening molecules or compounds
XX      to identify a ligand that specifically binds a cDNA comprises: combining
XX      the combination with molecules or compounds under conditions to allow
XX      specific binding; and detecting specific binding between each cDNA and at
XX      least one molecule or compound. The molecules or compounds are regulatory
XX      proteins. The combination is useful for preparing a composition for
XX      treating liver disorders associated with steroid therapy, e.g., cirrhosis
XX      or hepatitis. The present sequence represents a human protein which is
XX      differentially expressed in steroid-induced C3A liver cells. Note: The
XX      sequence data for this patent did not form part of the printed
XX      specification but was obtained in electronic format directly from USPTO
XX      at seqdata.uspto.gov/sequence.html.

XX

CC This protein is DBX1, which shows homology with RNA helicases but the

CC activity of a helicase has never been demonstrated and its function has

CC not yet been identified. DBX1 possesses the 8 characteristic motifs of

CC the helicases of the family "DEAD". In particular, it appears to be part

CC of the sub-family represented by helicase PL10. The DBX1 gene is situated

CC on the X chromosome and its homologue, which is situated on the Y

CC chromosome has 91 percent identity with a novel protein coding sequence.

CC The novel protein (see AAW96482) is a human topoisomerase III-alpha

CC interacting protein (TIII-a IP). TIII-a IP has structural features in

CC common with RNA helicases (e.g. DBX1), which are involved in destruction

CC of the nucleosome structure, supercoiling of DNA, segregation of newly

CC replicated chromosomes, and recombination and stabilization of the

CC genome. Agents that alter interaction between TIII-a IP and TIII-a

CC therefore modulate cell division, replication or repair, so may slow cell

CC translation, splicing and DNA recombination or repair, so may slow cell

CC growth, block the cell cycle or induce apoptosis. Antibodies and ligands

CC of TIII-a IP are used to prevent, treat or alleviate diseases that

CC involve abnormal regulation of the cell cycle, i.e. they are potential

CC anti-tumour (cytotoxic) agents

XX
PS Claim 2; Page 215-218; 2690pp; English.
XX
CC The present invention describes a method for examining ischaemic
CC conditions, comprising measuring the expression levels of particular
CC genes (i) in a test sample or determining the expression profile of a
CC gene group in the sample comprising genes selected from (i). The method
CC is useful for examining the ischaemic condition (e.g. compressive
CC ischaemia, occlusive ischaemia or vasospastic ischaemia) by measuring
CC expression levels of particular genes (ABI99202 to ABI99912, encoding the
CC protein sequences in ABB57020 to ABB57374) or by determining the
CC expression profile of a gene group comprising these genes. The expression
CC levels or expression profiles produced by these genes are used as an
CC indicator when screening for ischaemic condition-improving drugs or
CC therapeutics for ischaemic diseases. ABI99913 and ABI99914 represent PCR
CC primers for a mouse ischaemic condition related sequence, which are used
CC in the exemplification of the present invention

PT Identifying modulators of the p53 pathway for use in treating apoptotic
PT or cell proliferation disorders, comprises screening for agents that
PT modulate activity of a human ortholog of genes that modify the p53
PT pathway in Drosophila.
XX
PS Example 2; Page 565-567; 678pp; English.
XX
CC The invention relates to identifying (M1) a candidate p53 pathway
CC modulating agent, by contacting an assay system comprising a purified HM
CC polypeptide (human orthologue of genes that modify the p53 pathway in
CC Drosophila) or nucleic acid with a test agent under conditions, where but
CC for the presence of the test agent, the system provides a reference
CC activity, and detecting a test agent-biased activity of the assay system.
CC Also included are modulating (M2) a p53 pathway of a cell (comprising
CC contacting a cell defective in p53 function with a candidate modulator
CC that specifically binds to a HM polypeptide comprising an HM amino acid
CC sequence, where p53 function is restored), modulating (M3) a p53 pathway
CC in a mammalian cell (comprising contacting the cell with an agent that
CC specifically binds an HM polypeptide or nucleic acid) and diagnosing (M4)
CC a disease in a patient (comprising: (a) obtaining a biological sample
CC from the patient; (b) contacting the sample with a probe for HM
CC expression; (c) comparing the results with a control; and (d) determining
CC whether the comparison indicates a likelihood disease). (M1) is useful
CC for identifying modulators of the p53 pathway. A probe for HM expression
CC is useful for diagnosing breast, colon, kidney, lung and ovarian cancer,
CC in a patient, where the cancer has greater than 25 % expression level.
CC Modulators identified by (M1) are useful in a variety of diagnostic and
CC therapeutic applications, where disease or disorder prognosis is related
CC to defects in the p53 pathway, such as, angiogenesis, apoptotic or cell
CC proliferation disorders (e.g. cancer). Another two new methods (M2 and
CC M3) are useful for modulating the p53 pathway of a cell, thus restoring
CC the p53 function of the cell, so that the cell undergoes normal
CC proliferation or progression through the cell cycle. (M2) and (M3) are
CC also useful for treating defects in the p53 pathway such as angiogenic,
CC apoptotic or cell proliferation disorders. The present sequence
CC represents a human p53 pathway modifying protein

XX Claim 24; Page; 39pp; English.

PS

XX The invention relates to forming (M1) an isolated ribonucleoprotein (RNP) complex (C), involves contacting an RNA affinity substrate (S) comprising an RNP assembly sequence (AS) and an affinity tag, with a protein mixture to permit formation of (C) on AS, subjecting (C) to chromatographic separation, and subjecting (C) to affinity selection, where the affinity tag (e.g. bacteriophage MS2 coat protein in a fusion protein with E. coli maltose binding protein) binds to an affinity matrix. Also included are an isolated spliceosome preparation (isolated by (M1)), a RNA comprising an RNP complex binding site and at least one phase coat protein recognition site, a nucleic acid encoding the RNA, and treating (M2) a subject having a disorder associated with abnormal RNP complexes (by obtaining a sample of cells from a subject, purifying RNP complexes from the cells of the subject by (M1), determining the presence in the purified RNP complexes of one or more proteins, and normalising the amount of RNPs in the subject. (M1) is useful for forming an isolated RNP complex selected from a spliceosomal complex (selected from E, A, B and C complex), an hnRNP complex, an mRNA export complex, an mRNA localisation complex, an RNA editing complex, an intron complex, or an H complex. (M1) is useful in a diagnostic assay for determining whether a subject has abnormal RNP complexes, (M2) is useful for treating a subject having a disorder associated with abnormal RNP complexes. (M1) is useful for forming an isolated RNP complex such as a telomerase complex, a fragile X protein complex, a reverse transcriptase complex or a gene splicing complex. The present sequence represents a known human spliceosome associated protein (SAP) isolated by the methods of the invention. Note: The present sequence is not shown in the specification but was obtained from Genbank or Swissprot using the information provided in table 1 of the specification

XX Biomarkers useful for predicting or determining the response of a mammal
PT
PT to a cancer treatment comprising administration of a modulator of cyclin-
PT dependent kinase activity.
XX Claim 5; SEQ ID NO 2099; 141pp; English.
XX This invention describes a novel method of predicting or determining
CC whether a mammal will respond or is responding to an anti-cancer agent
CC that modulates cyclin-dependent kinase (cdk) activity. The method
CC comprises measuring the level of one or more biomarkers selected from
CC 2774 biomarkers given in the specification (nucleotide sequence SEQ ID
CC NO.1246 (Genbank EST W28729) is especially preferred). The method of the
CC invention is utilized in a kit for determining or predicting whether
CC patient would be susceptible or resistant to treatment by an agent
CC modulating cdk activity. The invention also describes a method for
CC utilizing individualized genetic profiles for treating diseases and
CC disorders based on patient's response and molecular level, specialized
CC microarrays comprising the biomarkers described, antibodies directed
CC against the biomarkers and a cell culture model to identify biomarkers.
CC The cdk modulator is preferably N-5-[(5-(1,1-Dimethylethyl)-2-
CC oxazolyl)methylthio]-2-thiazolyl-4-piperidine carboxamide, 0.5-L-
CC tartaric acid salt. Note: The sequence data for this patent did not form
CC part of the printed specification, but was obtained in electronic format
CC directly from WIPO at ftp.wipo.int/pub/published pct sequences. This
CC sequence represents a biomarker used in the method of the invention.

PT	Novel phytic acid biosynthetic enzymes used to alter the level of the								
PT	enzyme in transgenic plants.								
XX									
PS	Claim 5; Page 53-54; 63pp; English.								
XX									
CC	This sequence is an inositol 1,3,4-triphosphate 5/6-kinase (ITK) protein								
CC	of the invention. ITK is a phytic acid (Myo-inositol 1,2,3,4,5,6-								
CC	hexaphosphate) biosynthetic enzyme. The ITK enzymes of the invention may								
CC	be prepared recombinantly and used to raise antibodies, which are used								
CC	for detecting the enzymes in situ in cells or in vitro in cell extracts.								
CC	The polynucleotides of the invention may be used to create transgenic								
CC	plants in which the ITK levels are present at higher or lower levels than								
CC	normal, or in cell types or developmental processes where they are not								
CC	normally found. This would alter the level of 1,3,4-triphosphate 5/6								
CC	kinase found in those cells. In addition, it may be desirable to								
CC	eliminate expression of ITK genes for certain applications. The								
CC	polynucleotides also serve as a source of probes and primers, which are								
CC	useful for genetic mapping, as markers for traits linked to those genes,								
CC	and to isolate homologous sequences from other species, as well as for								
CC	physical mapping. Decreased amounts of phytate and increased amounts of								
CC	available phosphate in animal feeds such as corn would lead to improved								
CC	feed efficiency. The proteins of the present invention lead to a better								
CC	understanding of the phytic acid biosynthesis pathway, allowing it to be								
CC	exploited for commercial uses, e.g. in animal feeds

XX New antisense nucleic acids, useful for identifying proteins or screening
PT for homologous nucleic acids required for cellular proliferation to
PT isolate candidate molecules for rational drug discovery programs.
XX Claim 25; SEQ ID NO 55157; 1766pp; English.
XX The invention relates to an isolated nucleic acid comprising any one of
CC the 6213 antisense sequences given in the specification where expression
CC of the nucleic acid inhibits proliferation of a cell. Also included are:
CC (1) a vector comprising a promoter operably linked to the nucleic acid
CC encoding a polypeptide whose expression is inhibited by the antisense
CC nucleic acid; (2) a host cell containing the vector; (3) an isolated
CC polypeptide or its fragment whose expression is inhibited by the
CC antisense nucleic acid; (4) an antibody capable of specifically binding
CC the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
CC proliferation or the activity of a gene in an operon required for
CC or a gene on which the test compound that influences the activity of
CC proliferation; (7) identifying a compound that influences the activity of
CC the gene product or that has an activity against a biological pathway;
CC required for proliferation, or that inhibits cellular proliferation; (8)
CC identifying a gene required for cellular proliferation or the biological
CC pathway in which a proliferation-required gene or its gene product lies
CC or a gene on which the test compound that inhibits proliferation of an
CC organism acts; (9) manufacturing an antibiotic; (10) profiling a
CC compound's activity; (11) a culture comprising strains in which the gene
CC product is overexpressed or underexpressed; (12) determining the extent
CC to which each of the strains is present in a culture or collection of
CC strains; or (13) identifying the target of a compound that inhibits the
CC proliferation of an organism. The antisense nucleic acids are useful for
CC identifying proteins or screening for homologous nucleic acids required
CC for cellular proliferation to isolate candidate molecules for rational
CC drug discovery programs, or for screening homologous nucleic acids
CC required for proliferation in cells other than *S. aureus*, *S. typhimurium*,
CC *K. pneumoniae* or *P. aeruginosa*. The present sequence is encoded by one of
CC the target prokaryotic essential genes. Note: The sequence data for this
CC patent did not form part of the printed specification, but was obtained
CC in electronic format directly from WIPO at
CC ftp.wipo.int/pub/published_pct_sequences

XX
XX Rosen CA, Barash SC, Ruben SM;
XX
XX WPI; 2001-465566/50.
XX N-PSDB; AAS41018.
XX
XX Novel polypeptides and polynucleotides useful for diagnosing, preventing,
XX treating neural, immune system, muscular, reproductive, pulmonary,
XX cardiovascular, renal, proliferative disorders and cancerous diseases.
XX
XX Claim 11; SEQ ID NO 1144; 1180pp; English.
XX
XX The present invention relates to the isolation of novel human enzyme
XX polypeptides, and the cDNA (AAS40785-AAS41684) and genomic sequences
XX encoding them. The enzyme polypeptides of the invention may comprise the
XX functional classes of oxidoreductases, transferases, hydrolases, lyases,
XX isomerases or ligases. The sequences of the invention are useful in the
XX diagnosis, treatment, prevention and/or prognosis of a wide range of
XX disorders, including hyperproliferative disorders (e.g. cancer),
XX immunodeficiency disorders (e.g. AIDS) autoimmune disorders (e.g.
XX arthritis), neurological disorders (e.g. Alzheimer's disease), metabolic
XX disorders (e.g. phenylketonuria), inflammatory disorders (e.g. asthma),
XX cardiovascular disorders (e.g. atherosclerosis), blood-related disorders
XX (e.g. haemophilia), reproductive disorders (e.g. infertility) and
XX infectious disorders (e.g. Influenza). The polynucleotides of the
XX invention can also be used in gene therapy. AAU22915-AAU23814 represent
XX the novel human enzyme polypeptides of the invention. Note: The sequence
XX data for this patent did not form part of the printed specification, but
XX was obtained in electronic format directly from WIPO at
XX ftp.wipo.int/pub/published_pot_sequences

 New isolated nucleic acid encoding a protein for diagnosing, preventing,
 treating or ameliorating medical conditions and used as food additives or
 preservatives.
 Claim 9; SEQ ID NO 1085; 837pp; English.
 The invention describes an isolated nucleic acid molecule (I) encoding a
 novel central nervous system protein. (I) and polypeptides (III) encoded
 by (I), are used to treat a medical conditions and in diagnosis of a
 pathological condition. Disorders which are diagnosed or treated include
 autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative
 disorders e.g. neoplasms of the breast or liver, cardiovascular disorders
 e.g. cardiac arrest, cerebrovascular disorders e.g. cerebral ischaemia,
 angiodysplasia, nervous system disorders e.g. Alzheimer's disease and
 amyotrophic lateral sclerosis, infections caused by bacteria, viruses
 e.g. Acquired immunodeficiency virus (AIDS) and fungi, ocular disorders
 e.g. corneal infection, gastrointestinal disorders e.g. dysphagia,
 adenocarcinomas and irritable bowel syndrome, reproductive system
 disorders e.g. testicular feminisation, endocrine disorders e.g. diabetes
 and pituitary dwarfism, cancers and disorders at the cellular level e.g.
 leukaemia, disorders involving neovascularisation e.g. malignancies,
 respiratory disorders e.g. nonallergic rhinitis, renal disorders e.g.
 acute kidney failure and blood related disorders e.g. myocardial
 infarction. The polypeptides can also be used to aid wound healing and
 epithelial cell proliferation, to prevent skin aging due to sunburn, to
 maintain organs before transplantation, for supporting cell culture of
 primary tissues, to regenerate tissues and in chemotaxis. The
 polypeptides can also be used as a food additive or preservative to
 increase or decrease storage capabilities, fat content, lipid, protein,

XX
PS Claim 11; SEQ ID NO 1085; 413pp; English.
XX
XX The invention describes an isolated polypeptide comprising an amino acid
CC sequence at least 90% identical to: a polypeptide fragment, domain,
CC epitope, or full-length protein of any one of 607 amino acid sequences
CC (I) described in the specification; a polypeptide fragment of (I), or the
CC encoded sequence contained in (II), having biological activity; or a
CC variant, allelic variant, or a species homologue of (I). The polypeptides
CC and nucleic acid molecules are useful for detecting, preventing,
CC diagnosing, prognosticating, treating or ameliorating medical conditions
CC such as neural disorders, e.g. Alzheimer's disease, Parkinson's disease,
CC Huntington's chorea, amyotrophic lateral sclerosis or multiple sclerosis,
CC immune system disorders, e.g. diabetes, rheumatoid arthritis, systemic

XX
XX Drmanac RT, Liu C, Tang YT;
XX
XX WPI; 2001-639362/73.
XX N-PSDB; AAS90800.
XX
XX New isolated polynucleotide and encoded polypeptides, useful in
XX diagnostics, forensics, gene mapping, identification of mutations
XX responsible for genetic disorders or other traits and to assess
XX biodiversity.
XX
XX Claim 20; SEQ ID NO 56972; 103pp; English.
XX
XX The invention relates to isolated polynucleotide (I) and polypeptide (II)
XX sequences. (I) is useful as hybridisation probes, polymerase chain
XX reaction (PCR) primers, oligomers, and for chromosome and gene mapping,
XX and in recombinant production of (II). The polynucleotides are also used
XX in diagnostics as expressed sequence tags for identifying expressed
XX genes. (I) is useful in gene therapy techniques to restore normal
XX activity of (II) or to treat disease states involving (II). (II) is
XX useful for generating antibodies against it, detecting or quantitating a
XX polypeptide in tissue, as molecular weight markers and as a food
XX supplement. (II) and its binding partners are useful in medical imaging
XX of sites expressing (II). (I) and (II) are useful for treating disorders
XX involving aberrant protein expression or biological activity. The
XX polypeptide and polynucleotide sequences have applications in
XX diagnostics, forensics, gene mapping, identification of mutations
XX responsible for genetic disorders or other traits to assess biodiversity
XX and to produce other types of data and products dependent on DNA and
XX amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic
XX amino acid sequences of the invention. Note: the sequence data for this
XX patent did not appear in the printed specification, but was obtained in
XX electronic format directly from WIPO at
XX ftp.wipo.int/pub/published_pct_sequences

XX
PT New isolated nucleic acid encoding a protein for diagnosing, preventing,
PT treating or ameliorating medical conditions and used as food additives or
PT preservatives.
XX
XX Claim 9; SEQ ID NO 788; 837pp; English.
PS
XX
XX The invention describes an isolated nucleic acid molecule (I) encoding a
CC novel central nervous system protein. (I) and polypeptides (III) encoded
CC by (I), are used to treat a medical conditions and in diagnosis of a
CC pathological condition. Disorders which are diagnosed or treated include
CC autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative
CC disorders e.g. neoplasms of the breast or liver, cardiovascular disorders
CC e.g. cardiac arrest, cerebrovascular disorders e.g. cerebral ischaemia,
CC angiogenesis, nervous system disorders e.g. Alzheimer's disease and
CC amyotrophic lateral sclerosis, infections caused by bacteria, viruses
CC e.g. Acquired immunodeficiency virus (AIDS) and fungi, ocular disorders
CC e.g. corneal infection, gastrointestinal disorders e.g. dysphagia,
CC adenocarcinomas and irritable bowel syndrome, reproductive system
CC disorders e.g. testicular feminisation, endocrine disorders e.g. diabetes
CC and pituitary dwarfism, cancers and disorders at the cellular level e.g.
CC leukaemia, disorders involving neovascularisation e.g. malignancies,
CC respiratory disorders e.g. nonallergic rhinitis, renal disorders e.g.
CC acute kidney failure and blood related disorders e.g. myocardial
CC infarction. The polypeptides can also be used to aid wound healing and
CC epithelial cell proliferation, to prevent skin aging due to sunburn, to
CC maintain organs before transplantation, for supporting cell culture of
CC primary tissues, to regenerate tissues and in chemotaxis. The
CC polypeptides can also be used as a food additive or preservative to
CC increase or decrease storage capabilities, fat content, lipid, protein,

XX DR New polynucleotide comprising a sequence encoding a polypeptide having
PT inositol 1,3,4-triphosphate 5/6-kinase activity, useful in genetic or
PT physical mapping for plant breeding.
XX Example 3; Fig 1; 32pp; English.
XX This invention relates to a novel isolated polynucleotide which comprises
CC a sequence encoding a polypeptide having inositol 1,3,4-triphosphate 5/6-
CC kinase activity and comprising a sequence having 80% identity based on
CC the Clustal alignment method with a fully defined sequence comprising 139
CC amino acids, or its complement. The polynucleotide is useful in genetic
CC or physical mapping for plant breeding. The present sequence is that of a
CC plant inositol 1,3,4-triphosphate 5/6-kinase which was used in the
CC exemplification of the invention.

 XX enzyme in transgenic plants.

XX PS Claim 5; Page 44-45; 63pp; English.

XX CC This sequence is an inositol 1,3,4-triphosphate 5/6-kinase (ITK) protein
 CC of the invention. ITK is a phytic acid [Myo-inositol 1,2,3,4,5,6-
 CC hexaphosphate] biosynthetic enzyme. The ITK enzymes of the invention may
 CC be prepared recombinantly and used to raise antibodies, which are used
 CC for detecting the enzymes in situ in cells or in vitro in cell extracts.
 CC The polynucleotides of the invention may be used to create transgenic
 CC plants in which the ITK levels are present at higher or lower levels than
 CC normal, or in cell types or developmental processes where they are not
 CC normally found. This would alter the level of 1,3,4-triphosphate 5/6
 CC kinase found in those cells. In addition, it may be desirable to
 CC eliminate expression of ITK genes for certain applications. The
 CC polynucleotides also serve as a source of probes and primers, which are
 CC useful for genetic mapping, as markers for traits linked to those genes,
 CC and to isolate homologous sequences from other species, as well as for
 CC physical mapping. Decreased amounts of phytate and increased amounts of
 CC available phosphate in animal feeds such as corn would lead to improved
 CC feed efficiency. The proteins of the present invention lead to a better
 CC understanding of the phytic acid biosynthesis pathway, allowing it to be
 CC exploited for commercial uses, e.g. in animal feeds

RESULT 48
A33504
Glutamate dehydrogenase (NADP) (EC 1.4.1.4) - Salmonella typhimurium
N;Alternate names: glutamic dehydrogenase; NADP-specific glutamate dehydrogenase
C;Species: Salmonella typhimurium
C;Date: 08-Dec-1989 #sequence_revision 23-Mar-1995 #text_change 05-Oct-2004
C;Accession: A33504
R;Bansal, A.; Dayton, M.A.; Zalkin, H.; Colman, R.F.
J. Biol. Chem. 264, 9827-9835, 1989
A;Title: Affinity labeling of a glutamyl peptide in the coenzyme binding site of NADP(+)
enosine 2',5'-bisphosphate.
A;Reference number: A33504; MUID:89255551; PMID:2656714
A;Accession: A33504
A;Molecule type: DNA

A;Residues: 1-447 <BAN>
A;Cross-references: UNIPROT:P15111; UNIPARC:UPI0000129306; GB:M24021; GB:J04814
C;Genetics:
A;Gene: gdh
A;Map position: 27 min
C;Superfamily: glutamate dehydrogenase
C;Keywords: homohexamer; NADP; oxidoreductase
F;128/Binding site: substrate (lys) #status predicted

Query Match 46.9%; Score 38; DB 1; Length 447;

CC -!- FUNCTION: Putative ATP-dependent RNA helicase. Possible role in a
CC key step of the spermatogenic process.
CC -!- TISSUE SPECIFICITY: Testis.
CC -!- DEVELOPMENTAL STAGE: High levels of PL10 during the meiotic and
CC haploid stages of spermatogenesis.
CC -!- SIMILARITY: Belongs to the DEAD box helicase family. DDX3
CC subfamily.

 CC -1- FUNCTION: ATP-dependent RNA helicase. Acts as a cofactor for XPO1-
 CC mediated nuclear export of incompletely spliced HIV-1 Rev RNAs.
 CC Also involved in HIV-1 replication. Interacts specifically with
 CC hepatitis C virus core protein resulting in a change in
 CC intracellular location.
 CC -1- SUBUNIT: Found in a complex with Rev and XPO1. Interacts with
 CC XPO1. Interacts with HCV core protein.
 CC -1- INTERACTION:
 CC Q00653:NFKB2; NbExp=1; IntAct=EBI-353779; EBI-307326;
 CC -1- SUBCELLULAR LOCATION: Located predominantly in nuclear speckles
 CC and, at low levels, throughout the cytoplasm. Located to the outer
 CC side of nuclear pore complexes (NPC). Shuttles between the nucleus
 CC and the cytoplasm in a XPO1-dependent manner.
 CC -1- SIMILARITY: Belongs to the DEAD box helicase family. DDX3
 CC subfamily.

XX PT Novel composition of matter comprising an Fc domain and pharmacologically
XX active peptides, useful for treating cancer and autoimmune diseases.
XX P8 Claim 19; Page 216; 608pp; English.
XX CC The present invention describes composition of matter (I) comprising an

CC Fc domain, pharmacologically active peptides, and linkers. Where (I) is:
CC (X1)a-P1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each
CC independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, -(L1)c-P1-
CC (L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2,
CC P3, and P4 = are each independently sequences of pharmacologically active
CC peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b,
CC c, d, e, and f = are each independently 0 or 1, provided that at least 1
CC of a and b is 1. The composition can have cytostatic, antiasthmatic,
CC thrombolytic and immunosuppressive activities. DNAs, vectors and host
CC cells from the present invention can be used for producing pharmaceutical
CC compositions. The compositions are useful for treating cancer, asthma,
CC thrombosis, or autoimmune diseases. The use of an Fc domain (rather than
CC a Fab domain) can provide a longer half-life or incorporate functions
CC such as Fc receptor binding, protein A binding, complement fixation, and
CC possibly placental transfer. AAG59443 to AAG63526 and AAB19355 to
CC AAB18003 represent nucleotide and amino acid sequences used in the
CC exemplification of the present invention

XX PT Novel vehicle-peptide molecule or its multimers useful for treating
XX inflammatory and autoimmune diseases, cancer, rheumatoid arthritis,
XX diabetic retinopathy, obesity, sleep disorders and infertility.

PS Claim 39; Page 43; 176pp; English.

XX The present invention describes a vehicle-peptide molecule (I) or its
CC multimers. (I) can have antiinflammatory, antitumour, immunosuppressive,
CC cytostatic, antirheumatic, antiarthritis, antidiabetic, ophthalmological,
CC antianaemic, anorectic, antiinfertility, haemostatic, dermatological and
CC neuroprotective activities. (I) can be used as a therapeutic or
CC prophylactic agent as well as for screening purposes. (I) is useful for
CC diagnosing diseases characterised by dysfunction of their associated
CC protein of interest, for identifying normal or abnormal proteins of
CC interest, as a part of diagnostic kit to detect the presence of their
CC proteins of interest in a biological sample. Additionally, (I) is useful
CC for treating inflammatory and autoimmune diseases, tumour growth, cancer,
CC rheumatoid arthritis, diabetic retinopathy, obesity, sleep disorders,
CC infertility, and neurological degenerative diseases. (I), comprising EPO-
CC mimetic compounds are useful for treating disorders characterised by low
CC red blood cell levels such as anaemia. The TPO-mimetic comprising
CC compounds are useful for treating conditions that involve an existing
CC megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet
CC deficiency, such as thrombocytopenia, aplastic anaemia, metastatic
CC tumour which result in thrombocytopenia, systemic lupus erythematosus,
CC and Fanconi's syndrome. ABB72403 to ABB73426 and ABL35695 to ABL35777
CC represent amino acid and nucleic acid sequences used in the
CC exemplification of the present invention

XX New CDR mimetibody comprising a portion of a heavy or light chain
PT variable region comprising human framework or ligand binding region,
PT useful for preparing a composition for treating e.g., immune,
PT cardiovascular or neurologic disease.

XX Disclosure; SEQ ID NO 497; 97pp; English.

XX This invention relates to novel mammalian CDR mimetibodies, specific
CC portions or variants thereof. Specifically, it refers to an antibody
CC fragment where a protein has been inserted into, or replaces a portion
CC of, one or more CDR regions, such that each CDR mimetibody comprises at
CC least one portion of a heavy chain or light chain variable region, which
CC itself comprises at least one human framework region and at least one
CC ligand binding region (LBR). The present invention describes human
CC mimetibodies, including modified immunoglobulins and cleavage products
CC that can be useful in gene therapy and the generation of transgenic
CC plants and animals. Furthermore, the CDR mimetibody is useful for
CC preparing compositions for modulating, treating or reducing the symptoms
CC of immune, cardiovascular, infectious, malignant and/or neurologic
CC diseases, as well as anaemia. Accordingly, they exhibit immunomodulator,
CC cardiant, antimicrobial, cytostatic and neuroprotective activities. This
CC peptide sequence is a TPO mimetic peptide sequence used to make a
CC mimetibody of the invention.

XX New CH1-deleted mimetibody polypeptides and nucleic acids, useful for
PT modulating, treating, alleviating, preventing an immune, cardiovascular,
PT or neurodegenerative disease or disorder, anemia, cancer, or infectious
PT diseases.

XX Claim 2; SEQ ID NO 497; 129pp; English.

XX This invention relates to CH1 deleted mimetibodies (and the DNA sequences

CC which encode them), compositions, methods and uses. The invention may be
 CC useful for the development of compounds with an immunosuppressive,
 CC cardiovascular, cardiac, hypotensive, neuroprotective, nootropic,
 CC antibacterial, virucide or fungicide activity. In addition, the disclosed
 CC sequences may prove useful for gene therapy. The CHI-deleted mimetibody
 CC is useful for diagnosing or treating a disease condition in a cell,
 CC tissue, organ or animal, specifically for modulating, treating,
 CC alleviating, preventing the incidence or reducing the symptoms of an
 CC immune, cardiovascular (for example arrhythmia, hypertension or heart
 CC failure), or neurodegenerative (for example multiple sclerosis, dementia
 CC or Alzheimer's disease) diseases or disorders, anaemia, cancerous
 CC conditions, or infectious diseases (for example bacterial, viral or
 CC fungal infection). The present sequence is that of a peptide which may be
 CC used during the creation of a mimetibody of the invention.

XX New CHI deleted mimetibody polypeptide and nucleic acid, useful for
 PT diagnosing, preventing or treating cardiovascular, dermatologic,
 PT endocrine, gastrointestinal, gynecologic, infectious, neurologic and

PT nutritional disorders.

XX Claim 14; SEQ ID NO 497; 123pp; English.

XX This invention relates to CHI deleted mimetibodies (and the DNA sequences
 CC which encode them), compositions, methods and uses. The invention may be
 CC useful for the development of compounds with an osteopathic,
 CC cardiovascular-Gen, dermatological-Gen, auditory, endocrine-Gen,
 CC gastrointestinal-Gen, gynaecological-Gen, hepatotropic, haemostatic,
 CC immunomodulator, antiallergic, ophthalmological, neuroleptic, nephrotropic or
 CC antiinflammatory, neuroleptic, ophthalmological, hepatotropic or
 CC respiratory-Gen activity acting as a tumour necrosis factor (TNF)-
 CC modulator or cytokine-agonist. The methods and compositions of the
 CC present invention are useful for the diagnosis, prevention and/or
 CC treatment of diseases or conditions associated with aberrant expression
 CC or activity of the CHI deleted mimetibody, such as a bone or joint,
 CC cardiovascular, dental or oral, dermatological, ear, nose or throat,
 CC endocrine, metabolic, gastrointestinal, gynaecological, hepatic,
 CC obstetric, haematologic, immunologic, allergic, infectious,
 CC musculoskeletal, oncological, neurological, nutritional, ophthalmologic,
 CC pediatric, psychiatric, renal or pulmonary disorders. The present
 CC sequence is that of a peptide which may be used during the creation of a
 CC mimetibody of the invention.

 XX Activating thrombopoietin receptors in cells, used to treat
 PT thrombocytopenia and hematological disorders, comprises contacting cells
 PT with peptides and peptide mimetics attached to hydrophilic polymers.
 XX Disclosure; Col 151; 128pp; English.
 PS
 XX Sequences AAU25815-AAU26049 represent peptides and peptide mimetics that
 CC bind to and activate the human thrombopoietin receptor (TPO-R). Methods
 CC of activating thrombopoietin receptors in cells comprise contacting the
 CC cells with effective amounts of peptides and peptide mimetics attached to
 CC hydrophilic polymers. The methods are used to treat thrombocytopenia such
 CC as that due to chemotherapy, radiation therapy or bone-marrow
 CC transplantation and to prevent thrombocytopenia in patients at risk. The
 CC sequences are used to treat and prevent hematological disorders
 CC including thrombocytopenia and platelet disorders. They are used in vitro
 CC as unique tools for understanding the biological role of thrombopoietin
 CC (TPO) and to develop other compounds that bind to and activate the TPO
 CC receptor. The peptides can be used to detect TPO receptors on living

CC cells and fixed cells, in biological fluids, in tissue homogenates, and
CC in purified or natural biological materials. They may also be used for in
CC situ staining, fluorescence-activated cell sorting, Western blotting and
CC enzyme-linked immunosorbent assay (ELISA). In addition, the peptides can
CC be used for in vitro expansion of megakaryocytes and their committed
CC progenitors alone or in conjunction with additional cytokines

XX
XX Activating thrombopoietin receptors in cells, used to treat
PT thrombocytopenia and hematological disorders, comprises contacting cells
PT with peptides and peptide mimetics attached to hydrophilic polymers.
XX
XX Disclosure; Col 151; 128pp; English.
XX
XX Sequences AAU25815-AAU26049 represent peptides and peptide mimetics that
CC bind to and activate the human thrombopoietin receptor (TPO-R). Methods
CC of activating thrombopoietin receptors in cells comprise contacting the
CC cells with effective amounts of peptides and peptide mimetics attached to
CC hydrophilic polymers. The methods are used to treat thrombocytopenia such
CC as that due to chemotherapy, radiation therapy or bone-marrow
CC transplantation and to prevent thrombocytopenia in patients at risk. The
CC sequences are used to treat and prevent haematological disorders
CC including thrombocytopenia and platelet disorders. They are used in vitro
CC as unique tools for understanding the biological role of thrombopoietin
CC (TPO) and to develop other compounds that bind to and activate the TPO
CC receptor. The peptides can be used to detect TPO receptors on living
CC cells and fixed cells, in biological fluids, in tissue homogenates, and
CC in purified or natural biological materials. They may also be used for in
CC situ staining, fluorescence-activated cell sorting, Western blotting and
CC enzyme-linked immunosorbent assay (ELISA). In addition, the peptides can
CC be used for in vitro expansion of megakaryocytes and their committed
CC progenitors alone or in conjunction with additional cytokines

XX
XX New CDR mimetibody comprising a portion of a heavy or light chain
PT variable region comprising human framework or ligand binding region,
PT useful for preparing a composition for treating e.g., immune,
PT cardiovascular or neurologic disease.
XX
XX Disclosure; SEQ ID NO 457; 97pp; English.
XX
XX This invention relates to novel mammalian CDR mimetibodies, specific
CC portions or variants thereof. Specifically, it refers to an antibody
CC fragment where a protein has been inserted into, or replaces a portion
CC of, one or more CDR regions, such that each CDR mimetibody comprises at
CC least one portion of a heavy chain or light chain variable region, which
CC itself comprises at least one human framework region and at least one
CC ligand binding region (LBR). The present invention describes human
CC mimetibodies, including modified immunoglobulins and cleavage products
CC that can be useful in gene therapy and the generation of transgenic
CC plants and animals. Furthermore, the CDR mimetibody is useful for
CC preparing compositions for modulating, treating or reducing the symptoms
CC of immune, cardiovascular, infectious, malignant and/or neurologic
CC diseases, as well as anaemia. Accordingly, they exhibit immunomodulator,
CC cardiant, antimicrobial, cytostatic and neuroprotective activities. This
CC peptide sequence is a TPO mimetic peptide sequence used to make a
CC mimetibody of the invention.

XX XX
XX CC This invention relates to CH1 deleted mimetibodies (and the DNA sequences
XX CC which encode them), compositions, methods and uses. The invention may be
XX CC useful for the development of compounds with an immunosuppressive,
XX CC cardiovascular, cardiant, hypotensive, neuroprotective, nootropic,
XX CC antibacterial, virucide or fungicide activity. In addition, the disclosed
XX CC sequences may prove useful for gene therapy. The CH1-deleted mimetibody
XX CC is useful for diagnosing or treating a disease condition in a cell,
XX CC tissue, organ or animal, specifically for modulating, treating,
XX CC alleviating, preventing the incidence or reducing the symptoms of an
XX CC immune, cardiovascular (for example arrhythmia, hypertension or heart
XX CC failure), or neurodegenerative (for example multiple sclerosis, dementia
XX CC or Alzheimer's disease) diseases or disorders, anaemia, cancerous
XX CC conditions, or infectious diseases (for example bacterial, viral or
XX CC fungal infection). The present sequence is that of a peptide which may be
XX CC used during the creation of a mimetibody of the invention.

 Thrombopoietin receptor-binding/activating peptide(s) and peptide
 mimetic(s) - useful in treatment of haematological disorders, esp.
 thrombocytopenia resulting from chemotherapy, etc.
 Claim 18; Page 89; 106pp; English.
 The present sequence is a compound which binds to thrombopoietin (TPO)
 receptor (TR). It has a molecular weight of < 8000 Da, and a binding
 affinity to TR as expressed by an IC50 of no more than about 100 nm. The
 compound (especially if modified, see features table) can be used for
 treating patients suffering from haematological disorders and

CC thrombocytopenia resulting from chemotherapy, radiation therapy or bone
 CC marrow transfusions. The peptide may also be used to maintain the
 CC proliferation and growth of TPO-dependent cell lines and for use in
 CC biological research, for detecting TPO receptors on living cells

PS Claim 24; Page 90; 113pp; English.
XX
XX The invention relates to a novel pharmacologically active peptide
CC conjugate having a reduced tendency towards enzymatic cleavage comprises
CC X and Z, where: (a) X is a pharmacologically active peptide sequence; and
CC (b) Z is a stabilising peptide sequence of 4-20 amino acid units
CC covalently bound to X, where each amino acid unit in the stabilizing
CC peptide sequence, Z being selected from Ala, Leu, Ser, Thr, Tyr, Asn,
CC Gln, Asp, Glu, Lys, Arg, His, Met, Orn, and amino acid units of formula -
CC NH-C(R1)(R2)-C(=O)-(1), where: R1 and R2 are H, 1-6C alkyl, phenyl, and
CC phenyl-methyl, where 1-6C-alkyl is optionally substituted with 1-3
CC substituents selected from halogen, hydroxy, amino, cyano, nitro.
CC sulfonyl, and carboxy, and phenyl and phenyl-methyl are optionally
CC substituted with 1-3 substituents selected from 1-6C-alkyl, 2-6C-alkenyl,
CC halogen, hydroxy, amino, cyano, nitro, sulfonyl, and carboxy, or R1 and R
CC 2 together with the C atom to which they are bound form a cyclopentyl,
CC cyclohexyl or cycloheptyl ring, e.g. 2,4-diaminobutanoic acid and 2,3-
CC diaminopropanoic acid; the ratio between the half-life of the peptide
CC conjugate and the half-life of the corresponding active peptide sequence,
CC X, when treated with carboxypeptidase A or leucine aminopeptidase in
CC about 50 mM phosphate buffer solution at about pH 7.4 and about 37 deg C
CC or in serum or plasma is at least about 2 (preferably at least about 10),
CC or when the pharmacologically active peptide X is not orally absorbed,
CC the conjugate is adsorbed, or a salt, with the proviso that the
CC pharmacologically active peptide conjugate is not selected from sequences
CC (ADI24837)-(ADI24841). The peptide conjugates can be used for treating
CC e.g. pain, HIV, cancer, diabetes, incontinence, hypertension, amnesia,
CC Alzheimer's disease, fever, depression, sex hormone regulation, eating
CC disorders, schizophrenia, osteoporosis or insomnia. They can also be used
CC for treating e.g. CNS disorders and as contraceptives. The conjugated
CC peptides are less susceptible to degradation by proteases compared to the
CC corresponding free pharmacologically active peptides. This sequence
CC represents a pharmacologically active peptide as the X part of the
CC peptide of the invention.

XX Novel composition of matter comprising an Fc domain and pharmacologically

XX active peptides, useful for treating cancer and autoimmune diseases.

XX Claim 19; Page 203; 608pp; English.

XX The present invention describes composition of matter (I) comprising an

XX Fc domain, pharmacologically active peptides, and linkers. Where (I) is:

XX (X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each

XX independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, -(L1)c-P1-

XX (L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2,

XX P3, and P4 = are each independently sequences of pharmacologically active

XX peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b,

XX c, d, e, and f = are each independently 0 or 1, provided that at least 1

XX of a and b is 1. The composition can have cytostatic, antiasthmatic,

XX thrombolytic and immunosuppressive activities. DNAs, vectors and host

XX cells from the present invention can be used for producing pharmaceutical

XX compositions. The compositions are useful for treating cancer, asthma,

XX thrombosis, or autoimmune diseases. The use of an Fc domain (rather than

XX such as Fc receptor binding, protein A binding, complement fixation, and

XX possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to

XX AAB18003 represent nucleotide and amino acid sequences used in the

XX exemplification of the present invention

 PS
 XX The present invention describes a vehicle-peptide molecule (I) or its
 CC multimers. (I) can have antiinflammatory, antitumour, immunosuppressive,
 CC cytosatic, antirheumatic, antiarthritic, antidiabetic, ophthalmological,
 CC antianaemic, anorectic, antiinfertility, haemostatic, dermatological and
 CC neuroprotective activities. (I) can be used as a therapeutic or
 CC prophylactic agent as well as for screening purposes. (I) is useful for
 CC diagnosing diseases characterised by dysfunction of their associated
 CC protein of interest, for identifying normal or abnormal proteins of
 CC interest, as a part of diagnostic kit to detect the presence of their
 CC proteins of interest in a biological sample. Additionally, (I) is useful
 CC for treating inflammatory and autoimmune diseases, tumour growth, cancer,
 CC rheumatoid arthritis, diabetic retinopathy, obesity, sleep disorders,
 CC infertility, and neurological degenerative diseases. (I), comprising EPO-
 CC mimetic compounds are useful for treating disorders characterised by low
 CC red blood cell levels such as anaemia. The TPO-mimetic comprising
 CC compounds are useful for treating conditions that involve an existing
 CC megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet
 CC deficiency, such as thrombocytopenia, aplastic anaemia, metastatic
 CC tumour which result in thrombocytopenia, systemic lupus erythematosus,
 CC and Fanconi's syndrome. ABB72403 to ABB73426 and ABL35695 to ABL35777

 XX PT A novel immunogen molecule comprising a region in which amino acid
 PT residues corresponding to at least a portion of the complementary
 PT determining region are replaced or fused with an erythropoietin or
 PT thrombopoietin mimetic.
 XX PT
 XX PS Claim 18; Page 6; 113pp; English.
 XX CC The present invention describes an immunoglobulin molecule or its fragment
 CC (I) comprising a region where amino acid residues corresponding to at
 CC least a portion of the complementary determining region (CDR) are
 CC replaced or fused with biologically active peptides e.g. a peptide
 CC mimetic such as an erythropoietin (EPO) or thrombopoietin (TPO) mimetic,
 CC that is flanked with proline at its carboxy terminus. (I) has
 CC antianaemic, haemostatic and nephrotropic activities, and can be used as
 CC a stimulator of proliferation, differentiation and maturation of
 CC haematopoietic cells, and a stimulator of haematopoiesis. (I) is useful
 CC for stimulating proliferation, differentiation or growth of
 CC promegakaryocytes or megakaryocytes, where (I) is contacted with
 CC promegakaryocytes or megakaryocytes, which results in increased platelet
 CC production. (I) with a region where amino acid residues corresponding to
 CC a portion of CDR is replaced with an EPO mimetic, or which has one or
 CC more of its CDRs fused to an EPO mimetic, is useful for increasing the
 CC production of red blood cells, where (I) is contacted with haematopoietic
 CC stem cells or their progenitors. (I) is useful for diagnostics or
 CC therapeutics, in cell isolation strategies, and for treating patients
 CC suffering from deficiency in cell populations caused by disease,
 CC disorders or treatments related to the suppression of haematopoiesis.

XX PT Adenoviral coat protein which permits production of adenoviral vectors
XX that bind and infect host cells not naturally infected by adenovirus,
XX comprises various non-native ligands.
XX
XX PS Claim 4; Page 45; 45pp; English.
XX
XX CC The invention relates to adenoviral coat proteins comprising various non-
XX native ligands. The invention provides a method of controlled gene
XX expression utilising selectively replicating competence and also a method
XX and a composition for targeting an adenoviral vector. A system
XX comprising a cell having a non-native cell-surface receptor, and a virus
XX having a non-native ligand which binds the non-native cell-surface
XX receptor of the cell is useful for propagating a virus and also for
XX assaying gene function. The system is also useful for isolating a nucleic
XX acid encoding a product comprising a desired property. Further the system
XX is useful for identifying functionally related coding sequences.
XX
XX CC Adenoviral vector comprising a non-native nucleic acid encoding a
XX therapeutic agent such as anti-tumour agent, preferably tumour necrosis
XX factor and a second non-native nucleic acid encoding an agent that
XX facilitates imaging and a targeting agent is useful for treating an
XX animal. The therapeutic agent can be used to treat cancer of the brain,
XX lung, ovary, breast and prostate. The present sequence is human non-
XX native ligand attached to an adenoviral vector

XX growth, or differentiation of hematopoietic cells, for treating or
XX preventing hematopoietic or immune disorders, e.g. thrombocytopenia.
XX
XX PS Claim 62; Page 71; 97pp; English.
XX
XX CC The invention discloses a variant of an immunoglobulin (Ig) variable
XX heavy or light chain domain that comprises at least one complementarity
XX determining region (CDR) and framework regions flanking the CDR. The CDR
XX also has added or substituted to it, at least one binding sequence which
XX is heterologous to the CDR and is an antigenic, agonistic sequence from a
XX thrombopoietin (TPO) receptor binding sequence. The antigenic sequence
XX can be a binding sequence heterologous to the CDR, a cytotoxic T-
XX lymphocyte (CTL)-epitope sequence, a T-helper cell sequence, a B-helper
XX cell sequence or a combination of each. The variant or thrombopoietin
XX synthebody, pharmaceutical and vaccine compositions are useful for
XX stimulating proliferation, growth or differentiation of haematopoietic
XX cells, particularly platelet progenitor cells. The variants are also
XX useful for treating or preventing haematopoietic or immune disorders
XX resulting from chemotherapy, radiation therapy, or bone marrow
XX transfusions (e.g. thrombocytopenia or disseminated intravascular
XX coagulation). Compositions comprising the synthebodies can be used for
XX the mobilisation, amplification and ex vivo expansion of stem cells and
XX committed precursor cells for autologous and allogeneic transplantation
XX as well as for the expansion of stem cells for gene therapy. They are
XX also useful as diagnostic or analytical reagents for studying the
XX function of thrombopoietin and its receptor in vivo or in vitro. The
XX sequence presented is the TPO receptor (MPL) agonist peptide, AF12505

XX Antibody targeting compound useful e.g. for diagnostic immunoassays and
PT treating microbial diseases comprises targeting or biological agent
PT covalently linked to combining site of the antibody.
XX
XX Example 7; Page 62; 56pp; English.
XX
XX The present sequence is that of thrombopoietin (TPO) mimetic peptide
CC AF12505, which mimics the activity of recombinant TPO. The invention
CC provides antibody targeting compounds that are used to reprogram the
CC specificity of an antibody. The antibody targeting compound is linked to
CC the combining site of the antibody, such that the modified antibody takes
CC on the binding specificity of the targeting agent. In an example from the
CC invention, a TPO receptor targeting antibody compound was prepared by
CC covalently linking peptide AB12505 to aldolase monoclonal antibody 38C2.
CC The TPO receptor targeting antibody compound can be used to treat
CC thrombocytopaenia resulting from chemotherapy and bone marrow
CC transplantation

PT ecotropic envelope protein useful for treating cancer.
XX

PS Disclosure; SEQ ID NO 1; 42pp; English.
XX
CC The present invention describes a chimeric retrovirus envelope protein
CC (1) comprising an ecotropic envelope protein and a heterologous short
CC peptide ligand inserted within the ecotropic envelope protein. Also
CC described: (1) a nucleic acid molecule comprising a sequence encoding the
CC recombinant chimeric envelope protein; (2) a vector comprising a nucleic
CC acid sequence encoding the chimeric envelope protein; (3) a recombinant
CC retroviral particle comprising a chimeric envelope protein comprising a
CC heterologous short peptide ligand; (3) altering retroviral tropism; (4)
CC identifying a nucleic acid sequence encoding the chimeric envelope
CC protein that alters viral tropism; (5) delivering a nucleic acid sequence
CC to a cell; and (6) treating cancer. (1) has cytostatic activity and can
CC be used in gene therapy. The chimeric retrovirus envelope protein is
CC useful for treating cancer, which comprises providing a cancer cell, e.g.
CC human cancer cell and infecting the cancer cell with a virus, e.g.
CC retrovirus comprising the chimeric envelope protein comprising a
CC heterologous short peptide ligand and a therapeutically useful gene, e.g.
CC encoding thymidine kinase. The present sequence represents an
CC erythropoietin receptor/erythropoietin consensus peptide, which is given
CC in the exemplification of the present invention.

PT variable region comprising human framework or ligand binding region,
PT useful for preparing a composition for treating e.g., immune,
PT cardiovascular or neurologic disease.
XX
XX Disclosure; SEQ ID NO 458; 97pp; English.
XX
XX This invention relates to novel mammalian CDR mimetibodies, specific
CC portions or variants thereof. Specifically, it refers to an antibody

CC fragment where a protein has been inserted into, or replaces a portion
 CC of, one or more CDR regions, such that each CDR mimetibody comprises at
 CC least one portion of a heavy chain or light chain variable region, which
 CC itself comprises at least one human framework region and at least one
 CC ligand binding region (LBR). The present invention describes human
 CC mimetibodies, including modified immunoglobulins and cleavage products
 CC that can be useful in gene therapy and the generation of transgenic
 CC plants and animals. Furthermore, the CDR mimetibody is useful for
 CC preparing compositions for modulating, treating or reducing the symptoms
 CC of immune, cardiovascular, infectious, malignant and/or neurologic
 CC diseases, as well as anaemia. Accordingly, they exhibit immunomodulator,
 CC cardiant, antimicrobial, cytostatic and neuroprotective activities. This
 CC peptide sequence is a TPO mimetic peptide sequence used to make a
 CC mimetibody of the invention.

XX Novel thrombopoietin mimetic peptides which bind to mpl receptor, and
 XX which stimulate the production of platelets and/or the production of
 XX platelet precursors, useful for treating thrombocytopaenia.

XX Disclosure; SEQ ID NO 1; 126pp; English.

XX The invention relates to a thrombopoietin mimetic peptide (TMP) (I) that
 CC binds to the c-mpl (mpl) receptor, and which stimulates the production of
 CC platelets and/or the production of platelet precursors, is new. Further
 CC disclosed is a composition of matter (II) that binds to an mpl receptor,
 CC and a pharmaceutical composition comprising (II) and a carrier. The
 CC pharmaceutical composition of the invention is useful for treating
 CC thrombocytopaenia in an animal, and for increasing megakaryocytes or

CC platelets in a patient. The TMP of the invention is useful for treating
 CC conditions involving a megakaryocyte and/or platelet deficiency, e.g.
 CC disease conditions involving thrombocytopaenia such as aplastic anaemia,
 CC autoimmune thrombocytopaenia, drug induced immune thrombocytopaenia,
 CC autoimmune haemolytic anaemia, Hughes's syndrome and lupoid
 CC thrombocytopaenia. The TMP of the invention is also useful for
 CC maintaining the viability or storage life of platelets and/or
 CC megakaryocytes and its derived cells. The compounds demonstrate an
 CC improved ability to bind to and/or trigger transmembrane signal through,
 CC i.e. activating, the mpl receptor the compounds have superior
 CC thrombopoietic activity, i.e. the ability to stimulate, in vivo and in
 CC vitro, the production of platelets and/or megakaryocytocytic activity,
 CC i.e. the ability to stimulate, in vivo and in vitro, the production of,
 CC platelet precursors. Further, certain of the compounds also exhibit
 CC superior therapeutic properties, such as improved plasma half-life,
 CC biological activity and in vivo circulation time. The current sequence
 CC represents a TMP of the invention.

XX New CHI-deleted mimetibody polypeptides and nucleic acids, useful for
 XX modulating, treating, alleviating, preventing an immune, cardiovascular,
 XX or neurodegenerative disease or disorder, anemia, cancer, or infectious
 XX diseases.

XX Claim 2; SEQ ID NO 458; 129pp; English.

XX This invention relates to CHI deleted mimetibodies (and the DNA sequences

CC which encode them), compositions, methods and uses. The invention may be
 CC useful for the development of compounds with an immunosuppressive,
 CC cardiovascular, cardiac, hypotensive, neuroprotective, nootropic,
 CC antibacterial, virucide or fungicide activity. In addition, the disclosed
 CC sequences may prove useful for gene therapy. The CHI-deleted mimetibody
 CC is useful for diagnosing or treating a disease condition in a cell,
 CC tissue, organ or animal, specifically for modulating, treating,
 CC alleviating, preventing the incidence or reducing the symptoms of an
 CC immune, cardiovascular (for example arrhythmia, hypertension or heart
 CC failure), or neurodegenerative (for example multiple sclerosis, dementia
 CC or Alzheimer's disease) diseases or disorders, anaemia, cancerous
 CC conditions, or infectious diseases (for example bacterial, viral or
 CC fungal infection). The present sequence is that of a peptide which may be
 CC used during the creation of a mimetibody of the invention.

PT nutritional disorders.

XX PS Claim 14; SEQ ID NO 458; 123pp; English.

XX CC This invention relates to CHI deleted mimetibodies (and the DNA sequences
 CC which encode them), compositions, methods and uses. The invention may be
 CC useful for the development of compounds with an osteopathic,
 CC cardiovascular-Gen, dermatological-Gen, auditory, endocrine-Gen,
 CC gastrointestinal-Gen, gynaecological-Gen, hepatotropic, haemostatic,
 CC immunomodulator, anti-allergic, muscular-Gen, cytostatic,
 CC anti-inflammatory, neuroleptic, ophthalmological, nephrotropic or
 CC respiratory-Gen activity acting as a tumour necrosis factor (TNF) -
 CC present invention are useful for the diagnosis, prevention and/or
 CC treatment of diseases or conditions associated with aberrant expression
 CC or activity of the CHI deleted mimetibody, such as a bone or joint,
 CC cardiovascular, dental or oral, dermatological, ear, nose or throat,
 CC endocrine, metabolic, gastrointestinal, gynaecological, hepatic,
 CC obstetric, haematologic, immunological, allergic, infectious,
 CC musculoskeletal, oncological, neurological, nutritional, ophthalmologic,
 CC pediatric, psychiatric, renal or pulmonary disorders. The present
 CC sequence is that of a peptide which may be used during the creation of a
 CC mimetibody of the invention.

XX XX Obtaining a recombinant fusion protein, useful for treating lupus,
 PT comprises providing a prokaryotic host cell carrying a nucleic acid
 PT encoding the recombinant protein operably linked to a promoter functional
 PT in the prokaryotic cell.

XX PS Claim 8; Page 48; 69pp; English.

XX CC The specification describes a method for obtaining a recombinant fusion
 CC protein comprising a scaffold of a C-terminal core protein of C4bp alpha

chain, where the recombinant fusion protein is capable of forming multimers in soluble form in a prokaryotic host cell. The method comprises providing a prokaryotic host cell carrying a nucleic acid encoding the recombinant protein operably linked to a promoter functional in the prokaryotic cell, culturing the host cell under conditions where the recombinant protein is expressed, and recovering the recombinant protein where the protein is recovered in multimeric form without performing a scaffold refolding step. The protein is useful for treating systemic lupus erythematosus. The present sequence represents a thrombopoietin agonist peptide, which is used to produce fusion proteins of the invention.

XX
XX Increasing hematopoietic stem cell production in subject, useful in reducing the incidence of delayed primary engraftment, comprises administering a Thrombopoietin mimetic compound e.g., a peptide to a subject.

XX Disclosure; Fig 2; 32pp; English.

XX The invention relates to a method (M1) for increasing haematopoietic stem cell production in a subject which involves administering a Thrombopoietin (TPO) mimetic compound to the subject. Also included is another method (M2) of providing haematopoietic stem cells to a subject which involves administering a TPO mimetic compound to a subject to enhance expansion of a stem cell population within bone marrow and/or mobilize stem cells in peripheral circulation, harvesting one or more of the bone marrow stem cells or the stem cells in the peripheral circulation, and transplanting the harvested stem cells into the subject.

CC A method (M3) is also provided for reducing a time to engraftment following reinfusion of stem cells in a subject, involves administering a TPO mimetic compound to the subject, enhancing the expansion of the stem cell population within bone marrow and/or mobilizing the stem cells in peripheral circulation, harvesting one or more of the bone marrow stem cells or one or more of the stem cells in the peripheral circulation, and transplanting the one or more harvested stem cells into the subject. TPO mimetic compounds are disclosed as peptides, including cyclic or modified peptides. (M1) is useful for increasing haematopoietic stem cell production in a subject e.g., human. (M3) is useful for reducing time to engraftment following reinfusion of stem cells, reducing the incidence of delayed primary engraftment, reducing the time of platelet and/or neutrophil engraftment following reinfusion of stem cells in a subject. (M1) is also useful for increasing the number of stem cells from a donor whose cells are then used for rescue of recipient subject. Also useful in the treatment of thrombocytopenia. (M1) enables transplantation to proceed in patients who would not otherwise be considered as candidates because of unacceptably high risk of failed engraftment, reduces the number of aphereses required to generate a minimum acceptable harvest, reduces the incidence of primary and secondary failure of engraftment by increasing the number of haematopoietic stem cells (HSCs) available for transplantation and reduces the time required for primary engraftment. The present sequence represents an example of TPO mimetic peptide fragment.

CC -!- FUNCTION: During replicative cycle of retroviruses, the reverse-
transcribed viral DNA is integrated into the host chromosome by
the viral integrase enzyme. RNase H activity is associated with
the reverse transcriptase.
CC -!- CATALYTIC ACTIVITY: Endonucleolytic cleavage to 5'-
phosphomonoester.
CC -!- CATALYTIC ACTIVITY: Deoxynucleoside triphosphate + DNA(n) =
diphosphate + DNA(n+1).
CC -!- PM: Cleavage sites that yield the mature proteins remain to be
determined.
CC -!- SIMILARITY: Belongs to the retroviruses Pol polyprotein family.
CC -!- SIMILARITY: Contains 1 integrase catalytic domain.
CC -!- SIMILARITY: Contains 1 integrase-type DNA-binding domain.
CC -!- SIMILARITY: Contains 1 integrase-type zinc finger.
CC -!- SIMILARITY: Contains 1 peptidase A2 domain.
CC -!- SIMILARITY: Contains 1 reverse transcriptase domain.
CC -!- SIMILARITY: Contains 1 RNase H domain.

RL Submitted (JUL-2005) to the EMBL/GenBank/DBJ databases.
CC -1- FUNCTION: Early post-infection, the reverse transcriptase converts
CC the viral RNA genome into double-stranded viral DNA. The RNase H
CC domain of the reverse transcriptase performs two functions. It
CC degrades the RNA template and specifically removes the RNA primer
CC from the RNA/DNA hybrid. Following nuclear import, the integrase
CC catalyzes the insertion of the linear, double-stranded viral DNA
CC into the host cell chromosome. Endogenous Pol proteins may have
CC kept, lost or modified their original function during evolution
CC (By similarity).
CC -1- SUBUNIT: Homodimer (By similarity).
CC -1- DOMAIN: The LPQG and YXDD motifs are catalytically important and
CC conserved among many retroviruses (By similarity).
CC -1- SIMILARITY: Contains 1 reverse transcriptase domain.

RT immunodeficiency virus-infected rapid progressor macaques: association
RT with CD4-independent usage of CCR5.";
RL J. Virol. 77:6405-6418(2003).
CC -1- FUNCTION: Early post-infection, the reverse transcriptase converts
CC the viral RNA genome into double-stranded viral DNA. The RNase H
CC degrades the RNA template and specifically removes the RNA primer
CC from the RNA/DNA hybrid. Following nuclear import, the integrase
CC catalyzes the insertion of the linear, double-stranded viral DNA
CC into the host cell chromosome. Endogenous Pol proteins may have
CC kept, lost or modified their original function during evolution
CC (By similarity).
CC -1- SUBUNIT: Homodimer (By similarity).
CC -1- DOMAIN: The LPOG and YXDD motifs are catalytically important and
CC conserved among many retroviruses (By similarity).
CC -1- SIMILARITY: Contains 1 reverse transcriptase domain.

RT and its impact on the production of L-aspartate-derived amino acids
RT and vitamins";
RL J. Biotechnol. 104:5-25(2003).
CC -1- FUNCTION: Site-specific tyrosine recombinase, which acts by
CC catalyzing the cutting and rejoining of the recombining DNA
CC molecules. The xerC-xerD complex is essential to convert dimers of
CC the bacterial chromosome into monomers to permit their segregation
CC at cell division. It also contributes to the segregational
CC stability of plasmids (By similarity).
CC -1- SUBUNIT: Forms a cyclic heterotetrameric complex composed of two
CC molecules of xerC and two molecules of xerD (By similarity).
CC -1- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
CC -1- SIMILARITY: Belongs to the "phage" integrase family. XerC type 1
CC subfamily.

Thrombopoietin receptor-binding/activating peptide(s) and peptide

mimetic(s) - useful in treatment of haematological disorders, esp.

thrombocytopenia resulting from chemotherapy, etc.

Disclosure; Page 26; 106pp; English.

CC The present sequence is a peptide which binds to thrombopoietin (TPO)
 CC receptor (TR). The compound can be used for treating patients suffering
 CC from haematological disorders and thrombocytopenia resulting from
 CC chemotherapy, radiation therapy or bone marrow transfusions. The peptide
 CC may also be used to maintain the proliferation and growth of TPO-
 CC dependent cell lines and for use in biological research, for detecting
 CC TPO receptors on living cells

Peptides and peptide mimetics which bind to and activate the

thrombopoietin receptor - useful in treatment of haematological

disorders, esp. thrombocytopenia resulting from chemotherapy, etc.

Disclosure; Page 26; 106pp; English.

XX The present peptide, which binds the thrombopoietin receptor (TR), can be

used to treat disorders which are susceptible to treatment with a

thrombopoietin agonist, preferably haematological disorders and

thrombocytopenia resulting from chemotherapy, radiation therapy or bone

marrow transfusions. It can also be used diagnostically, e.g. to

investigate the mechanism of thrombopoietin signal transduction and

receptor activation, or to maintain the proliferation and growth of

thrombopoietin dependent cell lines

XX Novel composition of matter comprising an Fc domain and pharmacologically
 active peptides, useful for treating cancer and autoimmune diseases.

XX Claim 19; Page 217; 608pp; English.

XX The present invention describes composition of matter (1) comprising an
 CC Fc domain, pharmacologically active peptides, and linkers. Where (1) is:
 CC (X1)a-P1-(X2)b, where: P1 = an Fc domain; X1 and X2 = are each
 CC independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, -(L1)c-P1-
 CC (L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2,
 CC P3, and P4 = are each independently sequences of pharmacologically active
 CC peptides; L1, L2, L3, and L4 = are each independently 0 or 1, provided that at least 1
 CC c, d, e, and f = are each independently 0 or 1, provided that at least 1
 CC of a and b is 1. The composition can have cytostatic, antiasthmatic,
 CC thrombolytic and immunosuppressive activities. DNAs, vectors and host
 CC cells from the present invention can be used for producing pharmaceutical
 CC compositions. The compositions are useful for treating cancer, asthma,
 CC thrombosis, or autoimmune diseases. The use of an Fc domain (rather than
 CC a Fab domain) can provide a longer half-life or incorporate functions
 CC such as Fc receptor binding, protein A binding, complement fixation, and
 CC possibly placental transfer. AA69443 to AA69526 and AAB16955 to
 CC AAB18003 represent nucleotide and amino acid sequences used in the
 CC exemplification of the present invention

XX PT Activating thrombopoietin receptors in cells, used to treat
 PT thrombocytopenia and hematological disorders, comprises contacting cells
 PT with peptides and peptide mimetics attached to hydrophilic polymers.

XX PS Disclosure; Col 20; 128pp; English.

XX CC Sequences AAU25815-AAU26049 represent peptides and peptide mimetics that
 CC bind to and activate the human thrombopoietin receptor (TPO-R). Methods
 CC of activating thrombopoietin receptors in cells comprise contacting the
 CC cells with effective amounts of peptides and peptide mimetics attached to
 CC hydrophilic polymers. The methods are used to treat thrombocytopenia such
 CC as that due to chemotherapy, radiation therapy or bone-marrow
 CC transplantation and to prevent thrombocytopenia in patients at risk. The
 CC sequences are used to treat and prevent hematological disorders
 CC including thrombocytopenia and platelet disorders. They are used in vitro
 CC as unique tools for understanding the biological role of thrombopoietin
 CC (TPO) and to develop other compounds that bind to and activate the TPO
 CC receptor. The peptides can be used to detect TPO receptors on living
 CC cells and fixed cells, in biological fluids, in tissue homogenates, and
 CC in purified or natural biological materials. They may also be used for in
 CC situ staining, fluorescence-activated cell sorting, Western blotting and
 CC enzyme-linked immunosorbent assay (ELISA). In addition, the peptides can
 CC be used for in vitro expansion of megakaryocytes and their committed
 CC progenitors alone or in conjunction with additional cytokines

XX PT Novel vehicle-peptide molecule or its multimers useful for treating
 PT inflammatory and autoimmune diseases, cancer, rheumatoid arthritis,
 PT diabetic retinopathy, obesity, sleep disorders and infertility.

XX PS Claim 39; Page 44; 176pp; English.

XX CC The present invention describes a vehicle-peptide molecule (I) or its
 CC multimers. (I) can have antiinflammatory, antitumour, immunosuppressive,
 CC cytostatic, antineumatic, antiarthritic, antidiabetic, ophthalmological,
 CC antianemic, anorectic, antiinfertility, haemostatic, dermatological and
 CC neuroprotective activities. (I) can be used as a therapeutic or
 CC prophylactic agent as well as for screening purposes. (I) is useful for
 CC diagnosing diseases characterised by dysfunction of their associated
 CC protein of interest, for identifying normal or abnormal proteins of
 CC interest, as a part of diagnostic kit to detect the presence of their
 CC proteins of interest in a biological sample. Additionally, (I) is useful
 CC for treating inflammatory and autoimmune diseases, tumour growth, cancer,
 CC rheumatoid arthritis, diabetic retinopathy, obesity, sleep disorders,
 CC infertility, and neurological degenerative diseases. (I), comprising EPO-
 CC mimetic compounds are useful for treating disorders characterised by low
 CC red blood cell levels such as anaemia. The TPO-mimetic comprising
 CC compounds are useful for treating conditions that involve an existing
 CC megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet
 CC deficiency, such as thrombocytopenia, aplastic anaemia, metastatic
 CC tumour which result in thrombocytopenia, systemic lupus erythematosus,
 CC and Fanconi's syndrome. ABB72403 to ABB73426 and ABL35695 to ABL35777
 CC represent amino acid and nucleic acid sequences used in the
 CC exemplification of the present invention

XX New CDR mimetibody comprising a portion of a heavy or light chain
XX PT variable region comprising human framework or ligand binding region,
XX PT useful for preparing a composition for treating e.g., immune,
XX PT cardiovascular or neurologic disease.
XX PS Disclosure; SEQ ID NO 502; 97pp; English.
XX XX
XX This invention relates to novel mammalian CDR mimetibodies, specific
XX CC portions or variants thereof. Specifically, it refers to an antibody
XX CC fragment where a protein has been inserted into, or replaces a portion
XX CC of, one or more CDR regions, such that each CDR mimetibody comprises at
XX CC least one portion of a heavy chain or light chain variable region, which
XX CC itself comprises at least one human framework region and at least one
XX CC ligand binding region (LBR). The present invention describes human
XX CC mimetibodies, including modified immunoglobulins and cleavage products
XX CC that can be useful in gene therapy and the generation of transgenic
XX CC plants and animals. Furthermore, the CDR mimetibody is useful for
XX CC preparing compositions for modulating, treating or reducing the symptoms
XX CC of immune, cardiovascular, infectious, malignant and/or neurologic
XX CC diseases, as well as anaemia. Accordingly, they exhibit immunomodulator,
XX CC cardiant, antimicrobial, cytostatic and neuroprotective activities. This
XX CC peptide sequence is a TPO mimetic peptide sequence used to make a
XX CC mimetibody of the invention.

PS Claim 15; SEQ ID NO 501; 123pp; English.

XX

CC This invention relates to CH1 deleted mimetibodies (and the DNA sequences

CC which encode them), compositions, methods and uses. The invention may be

CC useful for the development of compounds with an osteopathic,

CC cardiovascular-Gen, dermatological-Gen, auditory, endocrine-Gen,

CC gastrointestinal-Gen, gynaecological-Gen, hepatotropic, haemostatic,

CC immunomodulatory, antiallergic, muscular-Gen, cytostatic,

CC antiinflammatory, neuroleptic, ophthalmological, nephrotropic or

CC respiratory-Gen activity acting as a tumour necrosis factor (TNF)-

CC modulator or cytokine-agonist. The methods and compositions of the

CC present invention are useful for the diagnosis, prevention and/or

CC treatment of diseases or conditions associated with aberrant expression

CC or activity of the CH1 deleted mimetibody, such as a bone or joint,

CC cardiovascular, dental or oral, dermatological, ear, nose or throat,

CC endocrine, metabolic, gastrointestinal, gynaecological, hepatic,

CC obstetric, haematologic, immunologic, allergic, infectious,

CC musculoskeletal, oncological, neurological, nutritional, ophthalmologic,

CC pediatric, psychiatric, renal or pulmonary disorders. The present

CC sequence is that of a peptide which may be used during the creation of a

CC mimetibody of the invention.

PT Novel polypeptides and nucleic acids homologous to transmembrane
 PT receptor, thymosin, neuromodulin-like family of proteins for diagnosing,
 PT treating cancer, atherosclerosis, neurological, skin and autoimmune
 PT disorders.
 XX
 XX Claim 1c; Page 99; 323pp; English.
 XX
 XX The invention relates to 24 novel human proteins designated NOV1-NOV14
 CC (ABB09501-ABB09524), collectively referred to as NOVX proteins, and
 CC nucleic acids encoding them (ABQ93879-ABQ93902). NOVX proteins, and
 CC nucleotides are useful in the treatment, diagnosis or prevention of NOVX-
 CC associated disorders or in the manufacture of a medicament for treating
 CC such disorders, with specific applications described for each of the 24
 CC NOVX proteins, based on their homology to known proteins. Various
 CC disorders are associated with NOVX proteins including neurological
 CC disorders (e.g., Alzheimer's, Huntington's and Parkinson's diseases),
 CC pain, behavioural disorders, addiction, tuberous sclerosis, cancers
 CC (e.g., colorectal cancer, leukaemia and osteosarcoma), immune disorders
 CC (e.g., allergies and autoimmune diseases), myasthenia gravis, asthma,
 CC various forms of arthritis, diabetes, thyroiditis, cardiovascular disease
 CC (e.g., hypertension), reproductive disorders, endometriosis,
 CC incontinence, psoriasis, scleroderma, alopecia, ulcers, pancreatitis,
 CC cirrhosis, glomerular endotheiosis, polycystic kidney disease, endocrine
 CC disorders, obesity, bacterial infections and particularly cardiomyopathy,
 CC atherosclerosis, cell signal processing-related disorders and disorders
 CC of metabolic pathway regulation. NOVX nucleic acids and polypeptides may
 CC be used to identify cellular receptors or downstream effectors which
 CC binds to a NOVX protein, and are also useful as targets for the
 CC identification of small molecules that modulate or inhibit processes such
 CC as neurogenesis, cell differentiation, cell motility, cellular
 CC proliferation, haematopoiesis, wound healing and angiogenesis. NOVX
 CC nucleic acid sequences can be used to identify a cell or tissue type and
 CC are useful as a source of primers or probes for forensic biology and for
 CC identifying and cloning NOVX homologues in other cell types. Cells
 CC comprising NOVX nucleic acids are useful for producing non-human
 CC transgenic animals which are useful for studying the function and
 CC activity of NOVX proteins and for identifying and evaluating modulators
 CC of NOVX activity. The present sequence represents the RNase-like protein
 CC NOV8. The gene encoding NOV8 is located on chromosome 14

		The invention relates to novel human APP proteins (not defined) and the nucleic acids that encode them. APP proteins are useful as standards in assays of protein and protein inhibitors in both clinical and research settings, as protein and amino acid supplements, including hydrolysates. The nucleic acids are useful for radiation hybrid mapping. Secretary fusion proteins of APP are useful in cancer therapy, for enhancing in vitro cytotoxicity, for enhancing in vivo killing of target tissues, and for targeted cells or tissue inhibition or ablation. Anti-APP antibodies are useful for isolating target polypeptides by affinity purification, in diagnostic assays for determining circulating or localised levels of target polypeptides, for tissue typing, for cell sorting, for screening expression libraries, for generating anti-idiotypic antibodies, and as neutralising antibodies or as antagonists to block protein activity in vitro and in vivo. APP proteins and nucleic acids may be used to diagnose or treat (e.g. by gene therapy) diseases associated with the malfunction of the APP e.g. AβP6924 and Marfan's syndrome, AβP576853/AβP39158 and CC thrombocytopaenia, leukaemia, porphyria, Gilles De La Tourette's CC syndrome, AβP652829 and squamous cell carcinoma, diabetes mellitus, CC Grave's disease, AβP664311 and colon cancer, AβP253034 and Alzheimer's CC disease and AβP686580 and epiphyseal dysplasia. Many more examples of CC disease are given in the specification. The present sequence represents CC an APP of the invention

 XX Novel isolated Zrnasei polypeptide which is a member of the human
 PT ribonuclease family, useful for treating tumors, Addison's disease,
 PT Crohn's disease, Grave's disease, Sjogren's syndrome and
 PT glomerulonephritis.
 XX Claim 3; Page 2; 89pp; English.
 XX The sequence represents the novel human ribonuclease Zrnasei protein. The
 CC invention relates to a novel isolated Zrnasei polypeptide which is a
 CC member of the human ribonuclease family, having a use in gene therapy.
 CC The Zrnasei polypeptide, nucleotides, antibodies and fusion proteins of
 CC the invention are useful for preventing or treating a disorder associated
 CC with excessive cellular proliferation such as tumour, and to prevent or
 CC to treat inflammation associated disorders such as Addison's disease,
 CC allergies, anaemia, asthma, atherosclerosis, bronchitis, Crohn's disease,
 CC ulcerative colitis, atopic dermatitis, diabetes mellitus,
 CC glomerulonephritis, gout, Grave's disease, irritable bowel syndrome,
 CC lupus erythematosus, multiple sclerosis, myasthenia gravis, myocardial
 CC or pericardial inflammation, osteoarthritis, osteoporosis, pancreatitis,
 CC rheumatoid arthritis, scleroderma, Sjogren's syndrome, and autoimmune
 CC thyroiditis. The polypeptide and polynucleotide may also be used as
 CC educational tools in laboratory practicum kits for courses related to
 CC genetics and molecular biology, protein chemistry and antibody production
 CC and analysis

 XX Novel nucleic acids encoding PRO polypeptides, used to diagnose the
 PT presence of tumors, such as prostate and breast tumors, in mammals and to
 PT screen for modulators of the compounds.
 XX Claim 11; Fig 124; 774pp; English.
 XX Sequences AAU29024-AAU29328 represent PRO polypeptides of the invention.
 CC The PRO polypeptides and their associated nucleic acids can be used to
 CC detect the presence of a tumour in a mammal by comparing the level of
 CC expression of a PRO polypeptide in a test sample of cells from the animal
 CC and a control sample of normal cells, whereby a higher level of
 CC expression in the test sample indicates the presence of a tumour in the
 CC mammal. Mammals include dogs, cats, cattle, horses, sheep, pigs, goats
 CC and rabbits but are preferably human. The polypeptides can be used to
 CC stimulate tumour necrosis factor (TNF) alpha release from human blood,
 CC when contacted with it. A specific polypeptide can be used to stimulate
 CC the proliferation or differentiation of chondrocyte cells. The PRO
 CC proteins can be used to determine the presence of tumours and also
 CC susceptibility to tumour development, particularly adrenal, lung, colon,
 CC breast, prostate, rectal, cervical, or liver tumours, in mammalian
 CC subjects. The oligonucleotide probes specific for the PRO nucleic acids
 CC can be used for genetic analysis of individuals with genetic disorders

XX
XX Full length GENSET human nucleic acids encoding potentially secreted
PT proteins, useful in gene therapy and vaccination against a variety of
PT diseases, and for diagnosis of those diseases.
XX
XX Claim 21; Page 808; 921pp; English.
XX
XX The invention relates to full length GENSET human nucleic acids encoding
CC potentially secreted proteins. The nucleic acids and the polypeptides
CC they encode may be used in the prevention, treatment and diagnosis of
CC diseases associated with inappropriate GENSET gene expression. For
CC example, they be used to treat disorders associated with decreased GENSET
CC gene expression by rectifying mutations or deletions in a patient's
CC genome that affect the activity of GENSET or by supplementing the
CC patient's own production of GENSET polypeptides. Conversely, antisense
CC nucleic acid molecules may be administered to down regulate GENSET
CC expression by binding with the cells' own genes and preventing their
CC expression. The sense and antisense nucleic acids may also be used as DNA
CC probes in diagnostic assays to detect and quantitate the presence of
CC similar nucleic acid sequences in samples, and hence to determine which
CC patients may be in need of restorative therapy. The GENSET polypeptides
CC may be used as antigens in the production of antibodies and in assays to
CC identify modulators (agonists and antagonists) of GENSET polypeptide
CC expression and activity. The present sequence is a GENSET polypeptide of
CC the invention

XX
XX Claim 1; Page 187-188; 238pp; English.
XX
XX The invention comprises the amino acid and coding sequences of human
CC secreted proteins (SECP). The SECP DNA and amino acid sequences of the
CC invention are useful for treating/preventing disorders associated with
CC decreased or elevated expression of SECP. The SECP DNA and protein
CC sequences are specifically useful for treating/preventing (i.e. gene
CC therapy and protein therapy): immune system disorders (e.g. AIDS, thymic
CC hypoplasia, anaemia, asthma or Crohn's disease); neurological disorders
CC (e.g. epilepsy, Huntington's disease, dementia or Parkinson's disease);
CC developmental disorders (e.g. Down's syndrome); and cell proliferative
CC disorders (e.g. cancer). The proteins ABP43477 - ABP43543 represent the
CC human secreted proteins (SECP) of the invention

CC Zrnase1. Zrnase1 and fusion proteins comprising it can be used to prevent
CC or to treat a disorder associated with excessive cellular proliferation.
CC Examples of such disorders include various types of tumours (e.g.
CC adenocarcinoma, leukaemia, lymphoma and melanoma). In addition, Zrnase1
CC can be used to prevent or to treat inflammation associated disorders,
CC such as Addison's disease, adult respiratory distress syndrome (ARDS),
CC allergies, anaemia, asthma, atherosclerosis, bronchitis, cholecystitis,
CC Crohn's disease, ulcerative colitis, atopic dermatitis, dermatomyositis,
CC diabetes mellitus, emphysema, atrophic gastritis, glomerulonephritis,
CC gout, Graves' disease, hypersinophilia, irritable bowel syndrome, lupus
CC erythematosus, multiple sclerosis, myasthenia gravis, myocardial or
CC pericardial inflammation, osteoarthritis, osteoporosis, pancreatitis,
CC polymyositis, rheumatoid arthritis, scleroderma, Sjogren's syndrome and
CC autoimmune thyroiditis. Zrnase1 can also be used to identify and to
CC isolate Zrnase1 substrates and inhibitors. The present sequence
CC represents human ribonuclease, Zrnase1

Three hundred and five nucleic acids encoding PRO polypeptides, useful for the manufacture of a medicament for diagnosing or treating tumor.

Claim 11; Fig 588; 707pp; English.

The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polynucleotides encoding them. The invention also relates to a method for stimulating the release of tumour necrosis factor alpha (TNF-alpha) from human blood by contacting the blood with a sequence of the invention, a method for stimulating the proliferation or differentiation of chondrocyte cells by contacting the cells with a PRO polypeptide and a method for detecting the presence of a tumour in a mammal. The polypeptides and polynucleotides are useful for the manufacture of a medicament for diagnosing or treating a tumour in a mammal. Sequences ABU85578-ABU85882 represent human PRO polypeptides of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at seqdata.uspto.gov/sequence.html

PT Three hundred and five nucleic acids encoding PRO polypeptides, useful in gene therapy, chromosome identification, tissue typing, and for detecting the presence of tumor in a mammal.
PT Claim 11; Fig 588; 707pp; English.
XX The invention relates to three hundred and five nucleic acids encoding PRO polypeptides (secreted and transmembrane), sequences 80% identical to them, or encoding a PRO polypeptide lacking its associated signal peptide or an extracellular domain of the PRO polypeptide, with or lacking its associated signal peptide. Also included are the encoded PRO proteins, PRO expression vectors, host cells transformed with the vector (used to produce PRO proteins), a chimeric molecule comprising the PRO polypeptide fused to a heterologous amino acid sequence, an anti-PRO antibody, a method for stimulating the release of tumor necrosis factor alpha (TNF-alpha) from human blood (by contacting the blood with PRO1079, PRO827, PRO791, PRO1131, PRO1316, PRO1183, PRO1343, PRO1760, PRO1567 or PRO4333), a method for stimulating the proliferation or differentiation of chondrocyte cells by contacting the cells with a PRO6023 polypeptide, a method for detecting the presence of tumor in a mammal and an oligonucleotide probe derived from any of the nucleotide sequences cited above. The PRO polypeptide or anti-PRO antibody is useful for preparing a medicament for treating a condition that is responsive to the PRO polypeptide or anti-PRO antibody. The PRO nucleotide sequences are useful as hybridisation probes in chromosome and gene mapping, or in generating antisense RNA and DNA. PRO nucleic acids are also useful in preparing PRO polypeptides, in assays to identify other proteins or molecules involved in a binding reaction, to generate transgenic animals or knockout animals, which in turn are useful in the development and screening of therapeutically useful reagents, for chromosome identification, and tissue typing. The PRO polypeptides and nucleic acid molecules are also useful for detecting the presence of a tumour in a mammal, stimulating the proliferation or differentiation of chondrocyte cells, stimulating the release of tumour necrosis factor-alpha from human blood, in gene therapy, or as molecular weight markers for protein electrophoresis purposes. The anti-PRO antibodies may be used in diagnostic assays for PRO, or for the affinity purification of PRO from recombinant cell culture or natural sources. The present sequence represents a PRO protein Sequence 199 AA;

PT New secreted and transmembrane PRO polypeptides and nucleic acids, useful
 PT in gene therapy, in chromosome and gene mapping, as chromosome markers,
 PT in tissue typing, and in chromosome identification.
 XX
 PS Claim 11; Fig 588; 706pp; English.
 XX
 CC The invention discloses human nucleic acids encoding secreted and
 CC transmembrane (PRO) polypeptides. Also disclosed is an antibody that
 CC specifically binds to the PRO polypeptide, a method for stimulating the
 CC release of tumour necrosis factor alpha (TNF-alpha) from human blood by
 CC contacting the blood a PRO polypeptide, a method for stimulating the
 CC proliferation or differentiation of chondrocyte cells by contacting the
 CC cells with a PRO polypeptide, a method for detecting the presence of a
 CC tumour in a mammal and an oligonucleotide probe derived from any of the
 CC PRO nucleotide sequences. The nucleotide sequences are useful as probes,
 CC in chromosome and gene mapping, in generating antisense RNA and DNA, in
 CC preparing PRO polypeptides by recombinant techniques and in gene therapy
 CC (e.g. for replacement of defective gene). The PRO polypeptides are useful
 CC as molecular weight markers for protein electrophoresis purposes, for
 CC chromosome identification, as chromosome markers, as therapeutic agents,
 CC for stimulating the release of TNF-alpha from human blood, for
 CC stimulating the proliferation or differentiation of chondrocytes and
 CC detecting the presence of a tumour. The PRO polypeptides and nucleic
 CC acids may also be used diagnostically for tissue typing. The sequences
 CC presented in ABU67406-ABU67710 are the PRO polypeptides of the invention

RT libraries.";
RL Submitted (JUL-2000) to the EMBL/GenBank/DBJ databases.
CC -I- FUNCTION: Acts as guanine nucleotide exchange factor (GEF) for
CC RhoA and RhoB GTPases (By similarity).
CC -I- SUBUNIT: Interacts with RHOA and RHOB (By similarity).
CC -I- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
CC -I- SIMILARITY: Contains 1 DH (DBL-homology) domain.
CC -I- SIMILARITY: Contains 1 PH domain.

T37464
probable glutathione transferase (EC 2.5.1.18) GST3 - Caenorhabditis elegans
C:Species: Caenorhabditis elegans
C:Date: 03-Dec-1999 #sequence_revision 03-Dec-1999 #text_change 09-Jul-2004
C:Accession: T37464
R:Tawe, W.N.; Eschbach, M.L.; Walter, R.D.; Henkle-Duehrsen, K.
submitted to the EMBL Data Library, June 1997
A:Description: Parquat mediates differential gene expression in C. elegans.
A:Reference number: Z21702
A:Accession: T37464
A>Status: preliminary; translated from GB/EMBL/DBJ
A:Molecule type: mRNA
A:Residues: 1-207 <TAW>
A:Cross-references: UNIPROT:O16116; UNIPARC:UPI0000083A0A; EMBL:AF010241; PIDN:AAB65419
A:Experimental source: strain Bristol N2
C:Genetics:
A:Gene: GST3
C:Superfamily: glutathione transferase
C:Keywords: transferase

T24395
dihydropteridine reductase (EC 1.6.99.7) - *Caenorhabditis elegans*
C/Species: *Caenorhabditis elegans*
C/Date: 02-Jun-2000 #sequence_revision 02-Jun-2000 #text_change 09-Jul-2004
C/Accession: T24395
R/Wilkinson, J.
submitted to the EMBL Data Library, October 1996
A/Reference number: Z19886
A/Accession: T24395
A/Status: translated from GB/EMBL/DBJ
A/Molecule type: DNA
A/Residues: 1-236 <WIL>
A/Cross-references: UNIPROT:Q9XVJ3; UNIPARC:UPI000007A04C; EMBL:Z81113; PIDD:CA803278.1
A/Experimental source: clone T03F6
C/Genetics:
A/Gene: CESP:T03F6.1
A/Map position: 3
A/Introns: 28/3; 63/2; 104/3; 194/2
C/Function:
A/Description: catalyzes the reduction of quinoxid 7,8-dihydrobiopterin to tetrahydrobiopterin (BH-4) is an essential cofactor for phenylalanine, tyrosine,
A/Note: tetrahydrobiopterin (BH-4) is an essential cofactor for phenylalanine, tyrosine,
C/Superfamily: dihydropteridine reductase
C/Keywords: biopterin; NAD; oxidoreductase
F/2-236/Product: dihydropteridine reductase #status predicted <MAT>
F/5-34/Region: beta-alpha-beta NAD nucleotide-binding fold
F/83,143/Binding site: substrate (Trp, Tyr) #status predicted

CC -!- FUNCTION: Early post-infection, the reverse transcriptase converts the viral RNA genome into double-stranded viral DNA. The RNase H domain of the reverse transcriptase performs two functions. It degrades the RNA template and specifically removes the RNA primer from the RNA/DNA hybrid. Following nuclear import, the integrase catalyzes the insertion of the linear, double-stranded viral DNA into the host cell chromosome. Endogenous Pol proteins may have kept, lost or modified their original function during evolution (By similarity).
CC -!- DOMAIN: The LTRG and YXDD motifs are catalytically important and conserved among many retroviruses (By similarity).
CC -!- SIMILARITY: Contains 1 reverse transcriptase domain.

 RT "A highly divergent HIV-2-related isolate.";
 RL Nature 342:948-950(1989).
 CC -1- FUNCTION: During replicative cycle of retroviruses, the reverse-
 transcribed viral DNA is integrated into the host chromosome by
 CC the viral integrase enzyme. RNase H activity is associated with
 CC the reverse transcriptase.
 CC -1- CATALYTIC ACTIVITY: Endonucleolytic cleavage to 5'-
 phosphomonoester.
 CC -1- CATALYTIC ACTIVITY: Deoxynucleoside triphosphate + DNA(n) =
 CC diphosphate + DNA(n+1).
 CC -1- CATALYTIC ACTIVITY: Endopeptidase for which the P1 residue is
 CC preferably hydrophobic.
 CC -1- PTM: Cleavage sites that yield the mature proteins remain to be
 CC determined.
 CC -1- SIMILARITY: Belongs to the retroviruses Pol polyprotein family.
 CC -1- SIMILARITY: Contains 1 integrase catalytic domain.
 CC -1- SIMILARITY: Contains 1 integrase-type DNA-binding domain.
 CC -1- SIMILARITY: Contains 1 integrase-type zinc finger.
 CC -1- SIMILARITY: Contains 1 peptidase A2 domain.
 CC -1- SIMILARITY: Contains 1 reverse transcriptase domain.
 CC -1- SIMILARITY: Contains 1 RNase H domain.

XX Thrombopoietin receptor-binding/activating peptide(s) and peptide
 PT mimetic(s) - useful in treatment of haematological disorders, esp.

XX thrombocytopenia resulting from chemotherapy, etc.

XX Disclosure; Page 27; 106pp; English.

CC The present sequence is a peptide which binds to thrombopoietin (TPO)
 CC receptor (TR). The compound can be used for treating patients suffering
 CC from haematological disorders and thrombocytopenia resulting from
 CC chemotherapy, radiation therapy or bone marrow transfusions. The peptide
 CC may also be used to maintain the proliferation and growth of TPO-
 CC dependent cell lines and for use in biological research, for detecting
 CC TPO receptors on living cells

XX
XX Peptides and peptide mimetics which bind to and activate the
XX thrombopoietin receptor - useful in treatment of haematological
XX disorders, esp. thrombocytopaenia resulting from chemotherapy, etc.
XX
XX Claim 19; Page 89; 106pp; English.
XX
XX The present peptide binds the thrombopoietin receptor (TR), has a
XX molecular weight of less than 8000 Da and a TR binding affinity as
XX expressed by an IC50 of no more than about 100 microM. It can be used to
XX treat disorders which are susceptible to treatment with a thrombopoietin
XX agonist, preferably haematological disorders and thrombocytopaenia
XX resulting from chemotherapy, radiation therapy or bone marrow
XX transfusions. It can also be used diagnostically, e.g. to investigate the
XX mechanism of thrombopoietin signal transduction and receptor activation,
XX or to maintain the proliferation and growth of thrombopoietin dependent
XX cell lines

XX
XX  Novel composition of matter comprising an Fc domain and pharmacologically
PT  active peptides, useful for treating cancer and autoimmune diseases.
XX
XX  Claim 19; Page 222; 608pp; English.
XX
XX  The present invention describes composition of matter (I) comprising an
CC  Fc domain, pharmacologically active peptides, and linkers. Where (I) is:
CC  (X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each
CC  independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, -(L1)c-P1-
CC  (L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2,
CC  P3, and P4 = are each independently sequences of pharmacologically active
CC  peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b,
CC  c, d, e, and f = are each independently 0 or 1, provided that at least 1
CC  of a and b is 1. The composition can have cytostatic, antiasthmatic,
CC  thrombolytic and immunosuppressive activities. DNAs, vectors and host
CC  cells from the present invention can be used for producing pharmaceutical
CC  compositions. The compositions are useful for treating cancer, asthma,
CC  thrombosis, or autoimmune diseases. The use of an Fc domain (rather than
CC  a Fab domain) can provide a longer half-life or incorporate functions
CC  such as Fc receptor binding, protein A binding, complement fixation, and
CC  possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to
CC  AAB18003 represent nucleotide and amino acid sequences used in the
CC  exemplification of the present invention

 XX diabetic retinopathy, obesity, sleep disorders and infertility.
 XX PS Claim 39; Page 44; 176pp; English.
 XX CC The present invention describes a vehicle-peptide molecule (I) or its
 CC multimers. (I) can have antiinflammatory, antitumour, immunosuppressive,
 CC cytostatic, antirheumatic, antiarthritic, antidiabetic, ophthalmological,
 CC antianaemic, anorectic, antiinfertility, haemostatic, dermatological and
 CC neuroprotective activities. (I) can be used as a therapeutic or
 CC prophylactic agent as well as for screening purposes. (I) is useful for
 CC diagnosing diseases characterised by dysfunction of their associated
 CC protein of interest, for identifying normal or abnormal proteins of
 CC interest, as a part of diagnostic kit to detect the presence of their
 CC proteins of interest in a biological sample. Additionally, (I) is useful
 CC for treating inflammatory and autoimmune diseases, tumour growth, cancer,
 CC rheumatoid arthritis, diabetic retinopathy, obesity, sleep disorders, EPO-
 CC infertility, and neurological degenerative diseases. (I), comprising EPO-
 CC mimetic compounds are useful for treating disorders characterised by low
 CC red blood cell levels such as anaemia. The TPO-mimetic comprising
 CC compounds are useful for treating conditions that involve an existing
 CC megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet
 CC deficiency, such as thrombocytopenia, aplastic anaemia, metastatic
 CC tumour which result in thrombocytopenia, systemic lupus erythematosus,
 CC and Fanconi's syndrome. ABB72403 to ABB73426 and ABL35695 to ABL35777

XX New CDR mimetibody comprising a portion of a heavy or light chain
PT variable region comprising human framework or ligand binding region,
PT useful for preparing a composition for treating e.g., immune,
PT cardiovascular or neurologic disease.

XX Disclosure; SEQ ID NO 516; 97pp; English.

XX This invention relates to novel mammalian CDR mimetibodies, specific
CC portions or variants thereof. Specifically, it refers to an antibody
CC fragment where a protein has been inserted into, or replaces a portion
CC of, one or more CDR regions, such that each CDR mimetibody comprises at
CC least one portion of a heavy chain or light chain variable region, which
CC itself comprises at least one human framework region and at least one
CC ligand binding region (LBR). The present invention describes human
CC mimetibodies, including modified immunoglobulins and cleavage products
CC that can be useful in gene therapy and the generation of transgenic
CC plants and animals. Furthermore, the CDR mimetibody is useful for
CC preparing compositions for modulating, treating or reducing the symptoms
CC of immune, cardiovascular, infectious, malignant and/or neurologic
CC diseases, as well as anaemia. Accordingly, they exhibit immunomodulator,
CC cardiant, antimicrobial, cytostatic and neuroprotective activities. This
CC peptide sequence is a TPO mimetic peptide sequence used to make a
CC mimetibody of the invention.

PT modulating, treating, alleviating, preventing an immune, cardiovascular,
PT or neurodegenerative disease or disorder, anemia, cancer, or infectious
PT diseases.
XX Claim 2; SEQ ID NO 516; 129pp; English.

XX This invention relates to CH1 deleted mimetibodies (and the DNA sequences
CC which encode them), compositions, methods and uses. The invention may be
CC useful for the development of compounds with an immunosuppressive,
CC cardiovascular, cardiant, hypotensive, neuroprotective, nootropic,
CC antibacterial, virucide or fungicide activity. In addition, the disclosed
CC sequences may prove useful for gene therapy. The CH1-deleted mimetibody
CC is useful for diagnosing or treating a disease condition in a cell,
CC tissue, organ or animal, specifically for modulating the symptoms of an
CC alleviating, preventing the incidence or reducing the symptoms of an
CC immune, cardiovascular (for example arrhythmia, hypertension or heart
CC failure), or neurodegenerative (for example multiple sclerosis, dementia
CC or Alzheimer's disease) diseases or disorders, anaemia, cancerous
CC conditions, or infectious diseases (for example bacterial, viral or
CC fungal infection). The present sequence is that of a peptide which may be
CC used during the creation of a mimetibody of the invention.

XX New immunoglobulin molecule comprising a region, where two
XX complementarity determining regions (CDRs) are replaced with EPO mimetic
XX or a TPO mimetic, useful for treating thrombocytopenia.
XX
XX Example 1; SEQ ID NO 45; 107pp; English.
XX
XX The invention relates to a novel immunoglobulin molecule or its fragment
XX comprising a region where amino acid residues corresponding to at least a
XX portion of a two complementarity determining regions (CDRs) are replaced
XX with a peptide mimetic selected from an erythropoietin (EPO) mimetic and
XX a thrombopoietin (TPO) mimetic. An immunoglobulin molecule of the
XX invention has immunosuppressive activity, and may have a use in
XX immunotherapy. The immunoglobulin molecule is useful for diagnosing or
XX treating thrombocytopenia as a result of chemotherapy, bone marrow
XX transplantation, or chronic diseases such as idiopathic thrombocytopenia.
XX The present sequence represents a TPO mimetic peptide with flanking
XX residues.

XX PS Example 1; SEQ ID NO 45; 139pp; English.
XX
XX The invention describes an immunoglobulin molecule or its fragment
XX comprising a region where amino acid residues corresponding to at least
XX a portion of two CDRs are replaced with a peptide mimetic selected from
XX an EPO mimetic or a TPO mimetic; or a region where amino acid residues
XX corresponding to at least a portion of a CDR is replaced by a peptide
XX mimetic including SEQ ID NO. 126 (not defined in the specification),
XX where X at each occurrence represents any amino acid. Also described are:

```

CC a nucleic acid encoding an immunoglobulin molecule or its fragment; an
 CC expression vector comprising the nucleic acid of (1); a host cell
 CC transformed with the expression vector of (2); producing an
 CC immunoglobulin molecule or its fragment; and a pharmaceutical carrier. Also
 CC disclosed are: engineering immunoglobulin molecules or fragments;
 CC creation of a library of monoclonal antibodies; stimulating
 CC proliferation, differentiation, or growth of megakaryocytes; and
 CC activating a homodimeric receptor protein. The immunoglobulin molecules
 CC are useful for treating HIV-infected patients, patients undergoing
 CC chemotherapy, bone marrow transplant patients, stem cell transplant
 CC patients, or patients suffering from myeloproliferative disorders. This
 CC is the amino acid sequence of an agonist TPO mimetic peptide used to
 CC replace a CDR in a rationally designed antibody.

XX New immunoglobulin molecule comprising a region where amino acid residues
 PT corresponding to at least a portion of a complementarity determining
 PT region is replaced with a peptide, for treating congestive heart failure,
 PT diabetes or obesity.

XX Example 1; SEQ ID NO 49; 152pp; English.

XX The invention relates to an immunoglobulin (Ig) molecule or its fragment
 CC comprising a region where amino acid residues corresponding to at least a
 CC portion of a complementarity determining regions (CDR) is replaced with a
 CC peptide selected from human brain natriuretic protein (hBNP), hBNP
 CC mimetics, glycogen phosphorylase (GLP)-1, GLP-1 mimetics, GLP-2, GLP-2
 CC mimetics, exendin, exendin mimetics, glucagons, glucagon mimetics and
 CC PACAP-38. Also included are a nucleic acid encoding the immunoglobulin
 CC molecule, an expression vector comprising the nucleic acid, a host cell
 CC transformed with the expression vector, producing an immunoglobulin
 CC molecule (or its fragment, comprising culturing the host cell under

CC conditions suitable for expression of the immunoglobulin or its
 CC fragment), a composition comprising an immunoglobulin (or its fragment)
 CC and a pharmaceutically acceptable carrier, treating congestive heart
 CC failure (comprising administering to the subject an immunoglobulin
 CC molecule or fragment comprising a region where amino acid residues
 CC corresponding to at least a portion of a CDR is replaced with a peptide
 CC selected from hBNP and hBNP mimetics), treating diabetes or obesity
 CC (comprising administering to a subject an immunoglobulin molecule or its
 CC fragment comprising a region where amino acid residues corresponding to
 CC at least a portion of a CDR is replaced with a peptide selected from GLP-
 CC 1, GLP-1 mimetics, GLP-2, GLP-2 mimetics, exendin, exendin mimetics,
 CC glucagons, glucagons mimetics and PACAP-38), preserving/improving beta-
 CC cell function (comprising administering to a subject an immunoglobulin
 CC molecule or fragment comprising a region where amino acid residues
 CC corresponding to at least a portion of a CDR is replaced with GLP-1),
 CC inducing endothelial-dependent relaxation of precontracted pulmonary
 CC artery rings (comprising administering to a subject an immunoglobulin
 CC molecule or fragment thereof comprising a region where amino acid
 CC residues corresponding to at least a portion of a CDR is replaced with
 CC GLP-1) and administering to a subject an immunoglobulin molecule or its
 CC fragment (comprising a region where amino acid residues corresponding to
 CC at least a portion of a complementarity determining regions (CDR) is
 CC replaced with a thiazolidinedione derivative), regulating adiponectin
 CC expression (comprising administering to a subject an immunoglobulin
 CC molecule or its fragment comprising a region where amino acid residues
 CC corresponding to at least a portion of a CDR is replaced with a
 CC thiazolidinedione derivative). The immunoglobulin is an anti-tetanus
 CC toxoid antibody (TT) where the heavy chain CDR2 and/or CDR3 are fully or
 CC partially replaced with a peptide listed above or (as described in the
 CC examples) a Thrombopoietin (TPO) mimetic, erythropoietin (EPO) mimetic
 CC or ANP (atrial natriuretic peptide). The molecule, composition and
 CC methods are useful for treating congestive heart failure, diabetes or
 CC obesity. The present sequence is a TPO mimetic peptide clone flanked by
 CC random amino acids for inclusion in an immunoglobulin of the invention.

XX
XX Activating thrombopoietin receptors in cells, used to treat
XX thrombocytopenia and hematological disorders, comprises contacting cells
XX with peptides and peptide mimetics attached to hydrophilic polymers.
XX
XX Disclosure; Col 20; 128pp; English.
XX
XX Sequences AAU25815-AAU26049 represent peptides and peptide mimetics that
XX bind to and activate the human thrombopoietin receptor (TPO-R). Methods
XX of activating thrombopoietin receptors in cells comprise contacting the
XX cells with effective amounts of peptides and peptide mimetics attached to
XX hydrophilic polymers. The methods are used to treat thrombocytopenia such
XX as that due to chemotherapy, radiation therapy or bone-marrow
XX transplantation and to prevent thrombocytopenia in patients at risk. The
XX sequences are used to treat and prevent hematological disorders
XX including thrombocytopenia and platelet disorders. They are used in vitro
XX as unique tools for understanding the biological role of thrombopoietin
XX (TPO) and to develop other compounds that bind to and activate the TPO
XX receptor. The peptides can be used to detect TPO receptors on living
XX cells and fixed cells, in biological fluids, in tissue homogenates, and
XX in purified or natural biological materials. They may also be used for in
XX situ staining, fluorescence-activated cell sorting, Western blotting and
XX enzyme-linked immunosorbent assay (ELISA). In addition, the peptides can
XX be used for in vitro expansion of megakaryocytes and their committed
XX progenitors alone or in conjunction with additional cytokines

New thrombopoietin synthebodies, useful for stimulating proliferation,
growth, or differentiation of hematopoietic cells, for treating or
preventing hematopoietic or immune disorders, e.g. thrombocytopenia.
Example 1; Page 75; 97pp; English.
The invention discloses a variant of an immunoglobulin (Ig) variable
heavy or light chain domain that comprises at least one complementarity
determining region (CDR) and framework regions flanking the CDR. The CDR
also has added or substituted to it, at least one binding sequence which
is heterologous to the CDR and is an antigenic, agonistic sequence from a
thrombopoietin (TPO) receptor binding sequence. The antigenic sequence
can be a binding sequence heterologous to the CDR, a cytotoxic T-
lymphocyte (CTL)-epitope sequence, a T-helper cell sequence, a B-helper
cell sequence or a combination of each. The variant or thrombopoietin
synthebody, pharmaceutical and vaccine compositions are useful for
stimulating proliferation, growth or differentiation of haematopoietic
cells, particularly platelet progenitor cells. The variants are also
useful for treating or preventing haematopoietic or immune disorders
resulting from chemotherapy, radiation therapy, or bone marrow
transfusions (e.g. thrombocytopenia or disseminated intravascular
coagulation). Compositions comprising the synthebodies can be used for
the mobilisation, amplification and ex vivo expansion of stem cells and
committed precursor cells for autologous and allogeneic transplantation
as well as for the expansion of stem cells for gene therapy. They are
also useful as diagnostic or analytical reagents for studying the
function of thrombopoietin and its receptor in vivo or in vitro. The
sequence presented, TPOVHCDR1, is the TPO receptor (MPL) agonist peptide
sequence contained within the immunoglobulin CDR consensus variable heavy
chain domain (CONVH)

XX The present peptide binds the thrombopoietin receptor (TR), has a
 CC molecular weight of less than 8000 Da and a TR binding affinity as
 CC expressed by an IC50 of no more than about 100 microm. It can be used to
 CC treat disorders which are susceptible to treatment with a thrombopoietin
 CC agonist, preferably haematological disorders and thrombocytopaenia
 CC resulting from chemotherapy, radiation therapy or bone marrow
 CC transfusions. It can also be used diagnostically, e.g. to investigate the
 CC mechanism of thrombopoietin signal transduction and receptor activation,
 CC or to maintain the proliferation and growth of thrombopoietin dependent
 CC cell lines

 PT Novel composition of matter comprising an Fc domain and pharmacologically
 PT active peptides, useful for treating cancer and autoimmune diseases.
 XX
 PS Claim 19; Page 22; 608pp; English.
 XX
 CC The present invention describes composition of matter (I) comprising an
 CC Fc domain, pharmacologically active peptides, and linkers. Where (I) is:
 CC (X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each
 CC independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, -(L1)c-P1-
 CC (L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2,
 CC P3, and P4 = are each independently sequences of pharmacologically active
 CC peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b,
 CC c, d, e, and f = are each independently 0 or 1, provided that at least 1
 CC of a and b is 1. The composition can have cytostatic, antiasthmatic,
 CC thrombolytic and immunosuppressive activities. DNAs, vectors and host
 CC cells from the present invention can be used for producing pharmaceutical
 CC compositions. The compositions are useful for treating cancer, asthma,
 CC thrombosis, or autoimmune diseases. The use of an Fc domain rather than
 CC a Fab domain) can provide a longer half-life or incorporate functions
 CC such as Fc receptor binding, protein A binding, complement fixation, and
 CC possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to
 CC AAB18003 represent nucleotide and amino acid sequences used in the
 CC exemplification of the present invention

XX
XX The present invention describes a vehicle-peptide molecule (I) or its
CC multimers. (I) can have antiinflammatory, antitumour, immunosuppressive,
CC cytostatic, anorectic, antiarthritic, antidiabetic, ophthalmological,
CC antianaemic, anorectic, antiinfertility, haemostatic, dermatological and
CC neuroprotective activities. (I) can be used as a therapeutic or
CC prophylactic agent as well as for screening purposes. (I) is useful for
CC diagnosing diseases characterised by dysfunction of their associated
CC protein of interest, for identifying normal or abnormal proteins of
CC interest, as a part of diagnostic kit to detect the presence of their
CC proteins of interest in a biological sample. Additionally, (I) is useful
CC for treating inflammatory and autoimmune diseases, tumour growth, cancer,
CC rheumatoid arthritis, diabetic retinopathy, obesity, sleep disorders,
CC infertility, and neurological degenerative diseases. (I), comprising EPO-
CC mimetic compounds are useful for treating disorders characterised by low
CC red blood cell levels such as anaemia. The TPO-mimetic comprising
CC compounds are useful for treating conditions that involve an existing
CC megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet
CC deficiency, such as thrombocytopenia, aplastic anaemia, metastatic

CC tumour which result in thrombocytopaenia, systemic lupus erythematosus,
CC and Fanconi's syndrome. ABB72403 to ABB73426 and ABL35695 to ABL35777

CC This invention relates to novel mammalian CDR mimetibodies, specific
CC portions or variants thereof. Specifically, it refers to an antibody
CC fragment where a protein has been inserted into, or replaces a portion
CC of, one or more CDR regions, such that each CDR mimetibody comprises at
CC least one portion of a heavy chain or light chain variable region, which
CC itself comprises at least one human framework region and at least one
CC ligand binding region (LBR). The present invention describes human
CC mimetibodies, including modified immunoglobulins and cleavage products
CC that can be useful in gene therapy and the generation of transgenic
CC plants and animals. Furthermore, the CDR mimetibody is useful for
CC preparing compositions for modulating, treating and/or reducing the symptoms
CC of immune, cardiovascular, infectious, malignant and/or neurologic
CC diseases, as well as anaemia. Accordingly, they exhibit immunomodulator,
CC cardiant, antimicrobial, cytostatic and neuroprotective activities. This
CC peptide sequence is a TPO mimetic peptide sequence used to make a
CC mimetibody of the invention.

PT diseases.
XX
XX Claim 2; SEQ ID NO 518; 129pp; English.

CC This invention relates to CHI deleted mimetibodies (and the DNA sequences
CC which encode them), compositions, methods and uses. The invention may be
CC useful for the development of compounds with an immunosuppressive,
CC cardiovascular, cardiant, hypotensive, neuroprotective, nootropic,
CC antibacterial, virucide or fungicide activity. In addition, the disclosed
CC sequences may prove useful for gene therapy. The CHI-deleted mimetibody
CC is useful for diagnosing or treating a disease condition in a cell,
CC tissue, organ or animal, specifically for modulating, treating,
CC alleviating, preventing the incidence or reducing the symptoms of an
CC immune, cardiovascular (for example arrhythmia, hypertension or heart
CC failure), or neurodegenerative (for example multiple sclerosis, dementia
CC or Alzheimer's disease) diseases or disorders, anaemia, cancerous
CC conditions, or infectious diseases (for example bacterial, viral or
CC fungal infection). The present sequence is that of a peptide which may be
CC used during the creation of a mimetibody of the invention.

XX New immunoglobulin molecule comprises a region where amino acid residues
PT corresponding to a portion of complementarity determining region (CDR) is
PT replaced with a peptide mimetic, useful for treating, e.g. HIV-infected
PT patients.
XX
PS Example 8; SEQ ID NO 152; 139pp; English.
XX
CC The invention describes an immunoglobulin molecule or its fragment
CC comprising: a region where amino acid residues corresponding to at least
CC a portion of two CDRA are replaced with a peptide mimetic selected from
CC an EPO mimetic or a TPO mimetic; or a region where amino acid residues
CC corresponding to at least a portion of a CDR is replaced by a peptide
CC mimetic including SEQ ID NO. 126 (not defined in the specification),
CC where X at each occurrence represents any amino acid. Also described are:
CC a nucleic acid encoding an immunoglobulin molecule or its fragment; an
CC expression vector comprising the nucleic acid of (1); a host cell
CC transformed with the expression vector of (2); producing an
CC immunoglobulin molecule or its fragment; and a composition comprising the
CC immunoglobulin or its fragment and a pharmaceutical carrier. Also
CC disclosed are: engineering immunoglobulin molecules or fragments;
CC creation of a library of monoclonal antibodies; stimulating
CC proliferation, differentiation, or growth of megakaryocytes; and
CC activating a homodimeric receptor protein. The immunoglobulin molecules
CC are useful for treating HIV-infected patients, patients undergoing
CC chemotherapy, bone marrow transplant patients, stem cell transplant
CC patients, or patients suffering from myeloproliferative disorders. This
CC is the amino acid sequence of an agonist TPO mimetic peptide used to

XX

XX New immunoglobulin molecule comprising a region where amino acid residues
PT corresponding to at least a portion of a complementarity determining
PT region is replaced with a peptide, for treating congestive heart failure,
PT diabetes or obesity.

XX

XX Example 8; SEQ ID NO 152; 152pp; English.

XX

XX The invention relates to an immunoglobulin (Ig) molecule or its fragment
CC comprising a region where amino acid residues corresponding to at least a
CC portion of a complementarity determining regions (CDR) is replaced with a
CC peptide selected from human brain natriuretic protein (hBNP), hBNP
CC mimetics, glycogen phosphorylase (GLP)-1, GLP-1 mimetics, GLP-2, GLP-2
CC mimetics, exendin, exendin mimetics, glucagons, glucagon mimetics and
CC PACAP-38. Also included are a nucleic acid encoding the immunoglobulin
CC molecule, an expression vector comprising the nucleic acid, a host cell
CC transformed with the expression vector, producing an immunoglobulin
CC molecule (or its fragment, comprising culturing the host cell under
CC conditions suitable for expression of the immunoglobulin or its
CC fragment), a composition comprising an immunoglobulin (or its fragment)
CC and a pharmaceutically acceptable carrier, treating congestive heart
CC failure (comprising administering to the subject an immunoglobulin
CC molecule or fragment comprising a region where amino acid residues
CC corresponding to at least a portion of a CDR is replaced with a peptide
CC selected from hBNP and hBNP mimetics), treating diabetes or obesity
CC (comprising administering to a subject an immunoglobulin molecule or its
CC fragment comprising a region where amino acid residues corresponding to
CC at least a portion of a CDR is replaced with a peptide selected from GLP-
CC 1, GLP-1 mimetics, GLP-2, GLP-2 mimetics, exendin, exendin mimetics,
CC glucagons, glucagon mimetics and PACAP-38), preserving/improving beta-
CC cell function (comprising administering to a subject an immunoglobulin

CC molecule or fragment comprising a region where amino acid residues
CC corresponding to at least a portion of a CDR is replaced with GLP-1,
CC inducing endothelial-dependent relaxation of precontracted pulmonary
CC artery rings (comprising administering to a subject an immunoglobulin
CC molecule or fragment thereof comprising a region where amino acid
CC residues corresponding to at least a portion of a CDR is replaced with
CC GLP-1) and administering to a subject an immunoglobulin molecule or its
CC fragment (comprising a region where amino acid residues corresponding to
CC at least a portion of a complementarity determining regions (CDR) is
CC replaced with a thiazolidinedione derivative), regulating adiponectin
CC expression (comprising administering to a subject an immunoglobulin
CC molecule or its fragment comprising a region where amino acid residues
CC corresponding to at least a portion of a CDR is replaced with a
CC thiazolidinedione derivative). The immunoglobulin is an anti-tetanus
CC toxoid antibody (TT) where the heavy chain CDR2 and/or CDR3 are fully or
CC partially replaced with a peptide listed above or (as described in the
CC examples) a Thrombopoietin (TPO) mimetic, erythropoietin (EPO) mimetic
CC or ANP (atrial natriuretic peptide). The molecule, composition and
CC methods are useful for treating congestive heart failure, diabetes or
CC obesity. The present sequence is a TPO mimetic peptide (full length, core
CC or flanked by random amino acids) for inclusion in an immunoglobulin of
CC the invention.
